 this be commonced hix pulilic ministrations at loukinfielt, Manchester, and the twighborhood. Erom the firat, hes preaching weoms to haye mate many converts and excited anch opporition. Fux a firet imprisothment took place in the year 10, in conswinuce of hin uppos ing the prewehur in the great stceplermoce at Notting hain, on a pimint of doctrine. In 16.0 he was impriaof the committing juatices, Hounget, of lasphemy. One of the combitting Justices, fomm. weted with erent vi ding him "tremble at the word of the Lord," First applied ding him "tremble at the word of the Lord," brst applied prison at Derby for about a year, the tino having been lengthened in consequence of his refissal to necept a commisnion as captain of one of the avkimente then being raised by Pariament. To hin belief of the unlawfalnese of all war, which prompted this refosal, whs
added at the same time a clear view of thi cnormity of added at the same time a clear view of thu enormity of
the puaishment of denth fur crimes uffecting property only, nad he cxerted himself to knve the life of af joor woman then in juil for thedt. Within ten years of Fox'
first appearance as a preacher, meetings of the Frivule first nppearance as a preacher, meetings of the Eriwado
were established in nust parts of Eagland. At the wame time, an wetively were they persecuted, that for amby yeme, thore wore seldum lesa than on thousand of them in prison. Cromwdll, thongh himself faverable to liberty of conscience, seems to have been unathe to curb the excesses of popular hostility launched in all quartera ogninst it sect which denoencerl all state interference with relgion, and matutained thint the gospel shonld be prearind withont fer or reward. Fox had seseral interviews with the Prutectur, having bern first sent to hin as much conversation, with ject of religion. Fox was albut to leave, when Cromwell caught him by the lumd, saying - " ('ome again to my honse, for if thou and I were but an hour of a day together, we ehould be nearer one to the other;" adding that he wisheil him "no nore ill than he and to bis own was commusioned to tell him that he was at liberty, and might go whither be would. Alnut a month after the restoration of Charles IL., Fox whe conmitted to han caster Castle, "on the charge of being a common distorher of the peace, and of enteavoring to make insurrection in jail some months, s hather curpus was obtained sind the anthoritirs showed their dishelief of thened, and charges loy allowing Fux himself, unbailed and uncuardel, to convey to London the sherifis return to the writ The hopes eutertained by the members of the soune soo ciety that they wond be allowed a lirenthing-time from persechtion, were dispelled at the commencempht of attempt of Frocions mesures which tonlowed the that Act empowering nongiatrotes to tonder the oaths of al legiance and supremuly to any person whom they thought fit to suspect, ako operated with great bo'verity
against the Friends: under its jrovisions Fox wat commatled to prixan at Lascaster in the buginuing of 16ith, whence he was remoyed to Scarbinnugh Castle, where he lay till the sutumn of 1666 . His tratement dnring the greater part of thin incarceration of aearly thrce years seems to have leen most inhaman, nad to have seriously affected his health. After his release, Fiox lation of the now large sochety, and to the subject of rducation, recomuneadag hin frienis to estabish schools for the instrnction of their children in "whatanver things were civil and usefnl in the erpation." In 1669 Finx
married Margaret Full, the widow of one of the judees of marricd Margaret Full, the widow of one of the judkes of
the Welsh courts. The year $26-10$ withesad the the Wesh courts. The yar 26.0 wituestal the pasing of
the most stringent of the conventicle acte, forbidding muder heavy penaltices the asarmbling for religious worthe family, except according to the usigen of the Church of Eagland. As a society the Friendn beem to have otond almost alone in their rafuenl to comply with it, and the pains and penalties of the law cousequently fell principally upon them. Fox exhorted his fricmls to their sufforisigs -nttending the meeting in firacecluarch Strect, where it was expected the storm would fort fall. for Barbadock, where he carrted hiakelf gratly in the intereste of religion and hamavity. It in interesting to trace in his narrative of this joorney the germ of that antions in lis sanccuspors. It wow whilst in this island that Fus drew up a statement of his own and his friende

belief in all the great doctrines of Christianity, -a statement clearly disproving their alleged sympathy with Sociman tenets. After aconsidernure time spent in Barbadues, Jamaica, and the North American contineut, be retorbed to Eagland in this. Here farther persecutions awaited him, Arrested fur holding a meeting for worgiance and supremacy, he noderweat $1+$ monthe imprisgatuent, and wis at length liberated by the Court of King's Bench on accoaut of the errors in lis indictment. In 16:7, io company with Penn and Barclay, who had foined the Succety alout ten years before, he paid a viait to Itolland and some parts of Germany, where his services seem to have been well recenved. The last 15 years of his life were tranquil as regards persoush molestation, but be cuatinued to be actively engaged in various ways in promoting the welfire of his brethren. Their perseentions continued throughout the reign of Charics ti, sive, ordured a genoral release of those imprisoned for conscience sake, the legal toleration of dissent was re served for the next reign. In the firat year of Williana and Mary was passed the bill which nullified the conventicle acts, aod allowed the Friends to make a solemn declaration in lien of takiog the oatho, and Fox had the gratificati,n of seeing the pablic worblhip of the So-
ciety legally recognized before his death. D. 1630 . In ciety legally recognized before his death. D. 1630 . In
persth, Fox was tall; in coantenance, manly, iutelligent, persom, Fox was tall; in coantenance, manly, iuteligent,
Bnd graceful: Aad in manners, biyo Wm . Penn, "eivil beyoud all forras of breeding," Fox's services io the Cliristian church will be variossly estimated necording on which he was the first in modern times to inpist, and which have now for 200 years distingnished the Society of Friends. The man limself must, however, be ackoowledged by all to have furnished a noble example of suffinching integrity. Never wontd he barter an iota of what he regarded as the Christian trath, to becore iommaity from ridicule and persecution. On religious liberty, elavery, the treatonent of prisonerz, capital punehment, \&c., his sentiments were far ia advance of the age ; while in ragard to oaths and war, there has beez const ho did applanmate is wot to be defonded neither ditl he blmaelf por do has fullowers in religions profee on, regard him as other than 4 fallible mortal. yet in hat prusest of opimion, which so often rubs the gilt from the timsel, while it polishes the diamoul, wo are fain to believe that on a moro faithfol page than that of the prejndiced historisn - in the hearta of the lowly and sincere - will a plnce of honor be muro and more
freely itcurded to the memory of Geo. Fox.
Fox. Charles $\$$ LMEB, a celebrated English atatemman minuter wis an minster, Eton, and Oxford, where his proficieacy in the intention of hisa father Lord Hollind, who had a high pioion of his capacity, that be shonld occupy a pronapiaion of his capacity, that be shonld occupy a prom-
inent station in the political world, and he accordingly procored for him aseat in parliament for the borough of hidlumst, when he was only 19. He, however, prudently remained silpht till he had attained the legal nge of member, and then we find him, in 1770 , niding the minatry, who rewarded him with the office of one of the lords

into which the glass vessels already formed are put, to into which the glass vessels aready ormed are put, to
be placed in the lower oven. over the workigg-furnace. Fract'ed, a. (Her.) Broked asnnder. Lat. fractio, Fraction,
breaking, frema frangere, to bresk.] State of Leing broken, especially by violence.
"The evident marks of fraction and rain." - Barnet. -A part, portion, or fragment.

The fractione of her faith." - Shaks.
(Avith, and Alg.) A part of any magnitude, integer
(whole nnubler), or unit. For eximple (whole nnuber), or unit. For example, "two nnd a can be distiognished, as one-half, two-fifthes, aud so on. In the fraction $1 / 3$ in arithmetic, or $\frac{a}{b}$ in algelora, the figore 1 , or $a$, is the nunarator, sod 3 , or $b$, is the denominator; sud they represeat that, if a whale number Is divided into thrce or $b$ parta, only one or a parts are
taken. In the addition of fractions, the fractions manst taken. In the addition of ractions, the fractions minst
be bronght down to the same denominator, and their numerators (as expressed in the valne of their new defraction. Thus, if we want to add $1 / 3$ and $\frac{2}{5}$, we must find the least common multiple of 3 and 5 , which is found to be 15 ; then, as 3 goes 5 times into 15 , and 5 nnmerators of the different fractions by these respective quotients, and then add the two quantities together Thus, $1 / 3$ added to $\frac{2}{5}$ will be 5 added 6 fifien'hs. The true definition of a fraction may be thus summed np : It is the dirision of its onmerator hy its detominator divided bys, - whence a fraction is oltained. Decimal fractions simplify calculations greatly, ns they are con-
structed on the principle of having one coinuren denominator -a multiple of ten: and thus fractions can Le added, Fultracted, and livided withont repeating over
and over the tedions procrss of luringing them down to and over the tedions prociss of bringing them down to a
conmon denominator.-Sce Amitametic and Decinals.

one of the commanest wrecidents to which one is liatile, one of the commonest wrodents to, which ons is liable,
eppecially in very cold weather, when the bobses are very enpecially in very cold weather, when the bolses are very
brittle, ainl in corthia conditions of the bonen themsetres. Frictures are diviled into simple, componnd, comminnted, nats complicated. Simple fructures aro those is which the frueture does not communicato with
tho extermal air. These are by far the most commonh
 bemag the mast subject to mjarive of this tescrijution.
Componal fractures are those in which one or more Compound fractures are those in which one or more
hones are lurokon, anl the fracturo commanicates with loues are lirokin, aml the fracture commumicates witt
the external air hy means of a wound in the soft parts Comuinuted fractures are these in which the botees are broken into several portions; while complicated fractures are such to ure conglicated with mutue other in-jury-as a wound of the principat artery of the lionl. Fractures are also tistituguished us transerse, oblique, or longitadinal, necording to their direction. A trans verse fractnre is nswally much more easily treated than may be kopt there without much dithoulty; wheren in the latter ense, they are lialle to be displaced by th movenents of the muscles or purts; also, in the latter
case, the contiguons sof parts are manch more lialhe to bo lacerated by broken edges of tho bone than in the former. In trenting the oblique fracture, tho limt shuthl, if possilife, bo placed in such a position as will relax the principal muscles cobuected with the bons the best. The getueral symptoms of $\pi$ fracture are d formity of the limb, caused vither by the overlappin of the hones, or effinion of blow, bymph, or scrum int the cellular tissue ; shurtening of the limb; and crepitus or a grating soumt when the endr of the sractured bone are moved upon each other. The treat ment of fractures consists in retaining the broken fragments, ns nearly is that state. Where dixpliacement has tiaken place, it is first of all necessary to suothe the mascular irritation by means of centle friction or warm fomentations, ufte which, by a gentle application of force, the bone is to restored, as nearly ha possible, to its proper position. placed in splints, which are thin pieces of woud, or other material of the requisite firmatss and length, shapead and hollowed out, 80 as to fit evenly without makin,
nodue pressure upon any part. The skin is to be nodue pressure upon suy part. The skith is to be
protected by folds of linen, or thin suft pads a little protected by folds of linen, or thin Buft pads a littic them from slipping. These are to he bount upon the limb with a moderato degree of pressure, and they ought to be removed and re-adjusted occisionally, in order to detect and rectify any deviathon that may be observable The mode of bealing, in eimple fractures, differs little from the manner in which bone is origiaally formed Inumediately after the fracture has takco place, a quantity of blood is ponred out into the surronnding cellular tissue by the vessels of the adjoining btructure- luftamened; lymph is poured out, by which the eada of the bones are united, and in whe beryy for the scomplishonent of this varios acconding t the bone broken, the are. constitution, \&c., of th patient. It is qnicker in children than in adults, and is occupied is from two to cing all ages, however, the time ment of componud fracture consista in platiog the broken bones in opposition, and heabing the externat wound, so as to convert the compuand into a siouple
fracture. This is best done, where it can be effected, by fracture. This is best done, where it can be effected, by bringing the edges of the wonnd tugether with adhesiv plaster, or with suturea if necessary. But the modes of fracture, are so varived, and depend in so irteat a menanse upon the circumstances of each particular case, that our limits do not admit of our entering upnon thew; which is the lesa to be recretted, as they can ooly be propert treated at the hands of askilfit surgeon.
(Min.) The manner in which a mineral breaks and by which its texture is displayed; as, a fibrous, foliated, or cobchoidal fractare.
$-r . a$. Tu break ; to burst asunder ; to separate, as continuons parts; to crack; as, to fracture a stona, to fracture the skull.
Fraetureil. p. $a$. Broken; cracked.

Rhone, the islands around $F$, and belonting to her, are of litle tey yourmontier, Belle-lle, and Ouessant Ushant) In the Mediterrwoware the isles of limeres Ushavt). In the Slediterrmbenalare the isles of Hires Ratobeau, Publegue, \&c., Hear Shaseilles. In the of st . Malo, of which Chausey is the pribctual. Guerd sey, Jersey, Alderney, \&c., belong to Eng.., and are the only renaius of the exteasive dominions the Englisb once possessed in F.-Mountuink. Of these the must con siderable are those of tho Alps, Pyrenees. Cevenines. Au yorgoe. Jura, and the Vosges. The Alps between $F$. and Italy have for their priscigal sunumts, Veotonx, Génere, hise, aod Pelvous, respectively $6,-00$. $11,88,12,02$ and 34,108 feet alnve the level of the sea. Amnng the Pyr Midi, and Perdu, respectively $9,340,9,+10$, and gearly 11,000 feet high. Amoug the Cevennes are Lozere xst, and Mezin, $5,59+$ feet high. The Anvergne have the Puy-de-Düne, 4,806 ; Cantal, 6,100 , and Mont-d'Or 6,188 feet. It was in ascending the Puy-de-llone that Pascul's famous discovery was made, that at greater ele vations the height of the column of the mercury in the barometer is diminished. The Jura, between $P$. and Switzerland, cnlminate in Reculet, 5,643 feet high, and the Vosges, between Lorraine and Alsace in the Ballou Alsace, $t, 6$ s above the level of the bea. These somof $F$. Rivers. The principal are the Seine, Loire, Garonne, and Rhône. The Scinc fulls inte the Eug. Chan nel. It is about 500 miles loug. Its astuary and the lower part of its course is subject to the phenomenon of the bore ( $q . v$. ), which sometimes occasions coosiderable dathage. The Loire is the largest, nnd traverses the centre of the empire, and falle into the Atlastic. It is abeut 620 m . long, 510 of which are navigable. The Garonne empties into the Buy of Biscay. It is about 350 on. long, 294 of which are narigable. The Bhone is 530 m. Jong, and falls into the Mediterranean, discharging by severil brancles, forming a delta. It is anvigaNuse voselle, Sambre Scheldt, and Lye, fowiog into Mewse, North Sea; the Somme. Oiee, Orne, Marae, Aisne, Yonne, and Eure, flowing into the Eing. Chanuel; the Blavet, Filaive, Adour, Allier. Cher, Indre, Vieune, Crense, Mayenne, Surthe, Gers, Dordogne, Ariege, Tarn, and Lot, falligg into the Atlantue and the Aude, Hér tult, Saone, Doubs, Isere, nad Durance, fulliog into the Mediterranean. Must of the chief rivers are connected by canals, thus greatly idereasing the means of intermal commnnication; aud it is estimated that there are nearly 400 nasigable streams, and 540 smailer ones in $F$.- Late largest is that of Grand Lien, in the depp of the Limer laige it is only 6 m . acrubs. In Ain aud Loire-ct-Cher. marbhes are uumerous. The extensive lagnods on the S . mud $\mathbf{8} \mathrm{W}^{\text {. coasts mud elsen here, are tuo shisllow to be }}$ uset otherwise than for fishing and salt-works. It is estimated that alout $1 / \mathrm{s}$ of the aren of $F$ is covered with foreste. Aluchg these the principal are those of Ardennes. Fontaisebleau, Conpligne, and Orleans. The general appearance of the country is level or gently undu lating. Geologically, the whole of $F$ : may be considered the one extensive hasili, the circumer-nce und centre of which consist of primitive lormations. hary ind tertiary spand the most widely diffusud primary tucks aro kramite, kikiss, micsceons and no killueous achints, and primitive limestone, In Venkee, jorphyry, diorite, aud pribinentides are found. In tho. Pyremeestalcarcous rock are very abundant, sone of which contail great number of organic rematios, even ut all wevation of over 10,000 feet. Porphyry of various kinds, some of which exhibit Erent beanty, is the prevailing rock of the logges. The Puy de-Dönte and some uther ndjucent mountaias have a base of trachyte, and in the Visfan eapecinlly, kroupe of gigantic banaltic colunme are met with, niternabig.
with calcareous strata containing fresk-water elichin. with calcareous strata contannig fresk-water enche streuns, and uther vuleanic products, clearly point to a time of comparatively recent voleanic netivity in that region. The secondary formation orcapise the spince fetwern the primitive formatiom of the contre and circhmforme of $F$. They arv ketherally calcareone or marly. It is on the thin soils at this formation flatrore growths yielding the fluest Burgumdy wiben nre raknd calcarenu, euclosing pront spantities of nhello and the renaine of fossit mummalia of lurgesime.  many, Spain, the I fited States, and her own colonics. With thede states the imports and exports amonnt to about ode-sixth of the whole exteroal commerce of the conntry. - The principle of frce trade was adopted in
1860 . The imports ia 1890 amounted to $\$ 492,194,800$, of which the U. S. cuntributed $\$ 44.199,451$ The exports for the stake period were $35 \% 5,961,401$, of which this cuantry railwuy in operation in $F$, sad $89,522 \mathrm{~m}$, of telegraph. Gev. I'revinas to the estahlishment of a republican goverument in 1870 , for which see Supplemext) the gov-
erument was an hereditary monarchy, with the title of euperor io the suvereigu. There were three houses of legislution, the Senate, the Legintutive Budy, and the Chancil of State. The Senate, liunted to $150 \mathrm{mem-}$
bere, was composed of farditals, ratrobaid, admirals, and bere, was composed of cardituls, ıanshais, admirals, and
of such citizens as the Euperor might thank proper to of such citizens as the Emperor might thank proper to
raise to thedignity of senators. They uereappointed for raise tu the dignity of senators. They wereappointed for
lite, and each senator had a salary of $\$ 6.000$ per antum. The Legratitive Budy was elected by the people on the principle of universal suffrage, and in the proportion of one represent. the period of each yessioa. The Coupcil of Etate, numhering fron to to 50 , was appointed by the Euperor and presided over by him. There were 11 numistrial departmeats, the beadsof which were:spointed and discharged by the Emperor. They tuok rank accordiog to the
length of time they had been mombers of the conncil, length of time they Had Meen mombers of the conncil, precedence of all the rest. The Emperor was irresponeible, and his person inviolable. He was the fonntain of all the honors and digtitiee in the state, was commandermake peace and declare war. No law was valid uriese sauctioned by him, and jostice was admitustered in his zame. The Cobncil of State prepared under the in his tion of the sovereign aud his minieters such projects of law as were to be lad before the Le gisletive Budy, aud to solve auy difficultiee which might ariee inadministrative
matters. The miniaters touk part, ex officio in the dematters. The winisters touk part, ex officio, in the de-
liberations of the Conncil of State. It wus the duty of liberations of the Conncil of state. It wus the duty of
the Legiolative Body to discuss add vote ang lavs sent
before it by the Council of State, ns well as the nomual The senate alone had ther right to receive gutitionk, nat
 out the panction of the semate. Chamges in the fandabuentat laws of the realm might be preprosed liy the Senate, with the concurrenee of the nimmeters; and shomid

 sunate to oppone the promulsatunt of alt han contrary conscience, indtivilual hinety, tual equality of all citizews before the law. The Remate was semmoned, and tho There is a justice of tho peace ia each cantun court of the first instatsce for each arrondisement, provisional court of nppeal is 27 of the principal towns and a tritumal of commered in every place where mercantile differences aro likely to oceur. and the wars in whicla louns had tween long cniguget, the burdens they obliganl hin to impose on his naljects and the vast delits he had coatranted. prosioced not only great suffering and minery, but nlso great discontuly During the regency and the kulsequeat phrt of the reition of Louis XV., abuses of all sorts muthiplied on all hands, and were no longer cuncualed by the dazzling splendor and magnificence of the preceding period; the nast worthless parasites obtained a predominating influence at court; the conmana of rieets and armses wite intrusted to the Dierest imbeciles; the finances were in volved in the grcatest disorder; und France und Europe Were scandalized and dagintel by the gross sensuality and vulgar profligacy of the king and his intimate asso-
ciates. Louis XiI., who asceorded the thirnne in 170 was actuated by the beat intentions, lint he wantel the firmuese of purpose and capacity required in so desperate a crisis. The abuses that infected the whole frume of society, though destructive of the pulilic interests, were either really advantageous, or belicyed to be bo, to a vas nanber of persons, inclaing the nobility and clergy; and it wonld have required a nimd of a very differeat order from that of Louis to have frustrated the solicitations, ietrigues, and calsals of such powerful purtice, and to have safely carried through the reforms that had heeome indispensable. At length, after a variety of futile in 1189, to bold a neecting of the States-General, whic had not beea convencd since 1614 , for effecting the neces eary changes, and avertitg a public bankruptcy. This was the commencement of that tremendous revolution which cont Louis XII, the crown and his life, and destroyed every vestige of the gavt. and inatitutions that existed when it broke out. The atrocities connected with the Revolntiot were the wild, but Dot nanatural exevsses of an nnitustructed pepulace, that had nutdenly The proncipated from a state of extreme dupradation The prokeriptions amt anarchy fy which the lievolntion surremoditectinu of fluirs the tulents ofthis extrair dimary man were surgasend only hy his anliftun, which by overateppine all houmbs, precipitated him into enter prises that nltimately led to his overthrow. In 1814 the Boarbon was raplacelt upon the throbe; but the elder branch had profitel as little as the Stuarta in England, under sinfilar circametances, liy the leskons of udiversity and is 18:0 they were reexpelled from the kiagthen. The crown was then nffered, unter certain cobditions, to Loais Philippe, Duke d'Orloans, by whom it was ar fepted. Ile has the merit of having contributed, ander enel period the peaco of $f$ and Gurope. but kengtiated the pultic by ho plume for molvacing and enriching lus chilifros, and by the corrmptoon which pervaded every department of his government. This led to tho
revitation of fibl. Qi, 1815 , and the establingment of the r-pulalic, prusided uver by a l'rovi-ional Guvernment. A nuw conntitution having bren voten by a "Constitwas elected head of the repulalic, fur 4 yearn, by $5,562,43$

Except Washington, whom in many qualities he much resembled, this contry yet ronks among ber the
where so great a man. D. in Phuladelphin, 1790 .
Frank lin. Sta Jons, an Englsh nivigator, in at Spils. by, Liucolnshire, 1886 . In 1806 he wha present at the and in 1819 was appointed to head an overland expedition from IIndson's Buy to the Arctic Ocean. After suffering many bardships, and being frequently on the verge of death, from bunger and fatiguc, he reached heme in iszz, when, in the following yenr, ho married a Miss Purden, the dinghter of wo architect, and the authoress of sevenil puetical effesions. In 1825 he submitted to Lord Bathnist a plau ${ }^{-}$for an expedition overland to the N.W. extremity of Aracricn, with the combined object Alsw of surveying the coast butweun the Muckeozie Copper-mine rivers," This proposition was nccepted aud six diys after ho left Liverpool, in the same vear, his wifo died. In Is 27 Captain $F$ : arrived at Liverpool where he was married a sucond time, and in 1ne9 had the bonor of kuighthoot conferred upon hisu. In 1843 Sir John set out on a third exprifition with two ships, called the Eirebus and Terror, and spent his first winter
in a cove butweea C.upe Rilcy aud Becechey Ishand. Afte in a cove betweea Cape Rilcy and Beechey Islind. After
that period many expeditions were dispatched, both that period many expeditions were dispatched, both
from Eaglad auil America, in search of Sir John, of from Eughad and Aluerica, in search of Sir John, of
whom there were no tidings, and not until is5 did the Whtem there were no thages rand Eugland that the brave navigntor nad his lervic compamons had, in nll probability, perished in the wioter of $18,50-51$. This intelligence, however, waoted contirmation, and Lady Franklin, who deserves all praise for the intelligeat persistency of her efforts her gallant hosband had really met the fate which it was generally believed ho had experienced. Accordingly, a last expedtion wat hitted out, and the metanchoty new was, in 1859, at leagth confirnsed by the return of Capt 3Leclintock, in the yacht Fhr, after a pursewering search for the lost alventurers. This officer lirought with hims indisputable proofs of the death of Sir John and the loss explorers wore found at Russ Curo and Point Victory At the latter place a record was discovered, whercio it was etated that sir Joho F. had died on the IIth of June, 1847. Other traces were fonod on the W. coast of King William's 1stand, as the various survivors of the expedition had struyed from each other, perhaps in
search of food, or the means of escaping from their dreary and desolate situations. C. F. Hall, the eminedt Aretic explorer, returned Sept. 1869 . from a five-years search for the remains of Sir Joho $F$ 's companions, brought back about 150 relics of the expedition, bonglit from the natives of king wimami had. It remaimen, Franklin party in bis expedition of $1874-80$.

One day she esglass dour, asd so terrified his apartment, smashing the into a fever, and after six weeks illoess died, Feb., 1713. Faederice William I., sun of the above, and futher of Fred rick the Great, was b. in 16s8, aud commenced his reign in 1713 , after having narried a daugbter of the
elector of Ilanover, afterwards (ieorge 1 . of England. In 1715 he declared wir arainst Charles Xill Sweden In 1715 he declared war abuinst conjunction with Deumark touk stralsund; hut, and in conjunction with Depmark touk stralsund, hut - The halits of thit sovereign were entirely military, and he labored unweariedly to promote the disciplina of his troops. One of hia strongest peculiarities was an extriardinary love for tall soldiers; aud is order to procure these sons of Anak, he had agents employed in all parts of Europe. He held science and literature in profound contempt; but money he worshipped, and mea of a military character after his own ideal her respected and encouraged. The conseqneace was, that he left an ahandant treasury and a well-appointed army of 66,000 mea. Fagoenack I1., communly called Prederick the Great, was
born 24 th January, 1712 , and began to reign in 1740 . He born 24 th January, 1712 , and began to reign in 1740 . He
foond himself in possession of a full treasury and a found himself in possession of a full treasury and a powerfin army, which he soon employed in attacking ( $1740-1742$ ). 1n $17+t$ he engaged in a second war with Austria, which was terminated in 1145, and left him in possession of Silesia, but with no angmentation of puwer, though his military reaown was raised thronghout Europe. The great struggle of the Seven Years 'War began in 1756. Prussia was now attacked hy the Austrians, the Rassians, the French, the Saxons, and the Swedes, ble. England was her unly ally. Prussin went thrungh the atruggla, and came out trinatphant. When the parace of Inliertsborg was conclutlob in 1763, Prussia did not cade an inch of land, or pay a dollar of money; and from that time forth she wate recognized as one of the five
great puwers of Enrope. For this glorions result she great puwers of Europe. For this glorions result she
was indelitel to her king. It is aut aerely the allitiry genius of Frederick, as displayed doriag the samgaiaary

campaigns of the Sevon Yeare' War, that demands our attention, for wo cannot hefp ulmirini, ulan his maral

his mistresses and favorites. He entered into the Triple An army in it 88 ; made an alliauce with the Portut Bent in 1592; took part io the second partition of Poland and made peace with France in 1795. Died, 1797 eedebice Whliam 111., king of Hrussia, son of the above cotounenced his reign in 1797 by maintaining a strict nentrality in the various alliances with and agadast Napuleon 1. In 1s05, however, he yielded to the solicitatiuns of Russia, allying himself with the Czar scuinst the French eraperor. The rapid campaign of 1s0u, and the defeat of the Prussians at Jena, opened the gates of Berlin to the enemy, io whose hands it remaiped till 1809. In 1807 the battle of Fredlaud led to the bumiliatiug peace of Tusit, by which Frederick lost hall his dounaions. Restored to his capital, the king dili gently endeavored to repair the evils of war; but new disusters overtook him, and his kingdoni suflered greatly laring the struggle from 1812 tu 1814 . Forced, in the poleon's army, he subsequently joined his troops with those of Russia. The allies having triumphed over the Freach at Leipsic. Frederick William, in 1514, eutered Paris with the Czar Alexander. He also accompanied tha latter to England in the same year. On the return of Napoleon from Elba, he once more joined the alties. ader Be victory of Waterloo, in which the Prussians Prasian Ber (whom see), played an important part losses she had sustained, under the wise and patern sway of Frederick, whose coustant effurts and nodera tion contrihuted greatly to the maintenance of peace D. 1840, - Throughout his life, he was a warm deteude We never redeemed his promise hawever, to bestow representative constitution on his people. The estab ishment of the provincial estates only affected very slightly the absolute power, which, it is true, he wielded wich ability, and with a kind of pateraal affection for his people. It may finally be said of him, that, a wavere between the absolutist party and the liberal party, he secared, as is the lot with most undecided men, the re spect and adherence of neither.
remerice Whllam IV., king of Prassia, on the death of his father, succeeded to the thrune in I840, 11e served, as a simple officer, in the campaigns of 1813 tad 1814 . and evinetd, at an early period of his life, a very great career. During the first yeara of his reign his subjects career. During the hrst yeara of bis reiga his subjects quiring the liberal constitution which had been pronised them in 1815, in retara for the great sacrifices they had made daring the continental war. 1u 1847, at a general diet of the Prassian states, many of these reforms were granted, and it was thonglit that the kingdom might escape the troubles of the next year's rovolution. lu
March, $18+8$, however, the people and the troops came March, 1818 , however, the people and the troops came
into collision, the king was obliged to change the minisinto collision, the king was obliged to change the ministry, to issue a general amnesty, and commence a war
in favor of Schleswig against Denuark, and to salute from his batcony the corysen of the insurgents. These humiliations were somewhat softened by his hopes of becoming emperor of a maited Germany, and by the success of his army in putting down an insarrection of the Poles in Posen. The miagled irresolutionradnbsolntism of Frederick, however, led him subsequently to other conflicts in Jons and Angnst of the same year; and it Was not until two coups-d'elat that Frederich, assisted by his army, succecled in retaining his nuthority ainabot unimpared by the powers he haul yielded. In the war
between the Western powers and Russia, the king preaerved a strict neutrality, ahthough earnestly solicited by each party to esponse its side in the conflict. In his hardly anythige I will not do for the emperor Nichulas whom 1 love; but if I remember that he is my father n-law, neither do 1 forket that Prossia ia not the bister in-luw of lussia." In 1856, in conseyucnce of an attack on Neufchitct by some Prusgian partisans, war was in danger of breaking out betwern Switzurland and J'ruebin; but this was avoiden, and a treaty concluded, in May, 1857, in reference to the king'e claims on that phace. In the complicution relative to the Danubiun principulitice, l'russia followed the Lead of France und lusnia saopposed to Enpland and Austria. Towayds tha ont of 1 sif, a severe illuess, resulting in the luss of nomimated regent, who nucceeded him at king in 186 I .

Free'-will, n. (Ethics.) Free woll, freedom and necessity coberty and necrssity, are terms employed to denote field of the most difficult questions is the whole over the determination of his own will. "1f," says
Reid, th in thy action he had power to will what he did Reid, "in any action he had power to will what he did, or not to will it, in that action he is free. Bnt if in every volontary action the determination of his will be
the necessary consequence of something involuntary in thistate of lis mind, or of something in his external circninstances, be is not free; he has not what I cal Freedom las a comoruonly been distinguished into free Frem from cosrcion, and treedatm frong uecessity Free dom froun coercion' implies on the ons haod, the abseace of all impediment or restraist, and on the other, the alisence of all compalsion or violence. Thns, if we are prevented from doiag what is in our power when we desire or will to do itt as if we were compelled to do it when we desirs and will not to do it. we are not free from coercion. Freedon from necessity, called also
liberty of election, implics froedon from anything liberty of election, implics froedom from anything
invincibly determining a moral ageot. This freedom invincinly determinibs a moral ageot. This freedom bas no motive or no nore inctination towarde one cogrse of action than another; for he may have motives prompting him more urgently to act in one direction rather that in another, and still have liberty of election, if he has tho power of determining in favor of another conrse of action. The noiversal language and practice of maokind is fonnderl upon a belief in a kibd of treeswill. To choose, to deliberate, to deternine, are expressions in every man'y mouth; and the whole of sur penal code is fonnded upon the conviction that gsen have the power of toing or alsteining from cer-
tain acts. But if we examine the matter more closely tain acts. But if we examine the matier more closmy, and look at the particular acts of "nes hife, we shat and that this freedom of choice does out metanly exist suppose. We fibd that if we know the circumatances and character of an individma, we can ealcnlate pretty correctly how he will act in at given case. A nam's babits, his education, his character, all go in some measure to determins his acting in a given case in a particalar way. Inence, therefore, every act of the will, in some degree at least, depends uphon something going before, or in the circumastances of the individtat: nhe in so far it is mot ahasolntely free. "What," Bny6 Cole-
ridge, "determines the man to a good and worthy nct, ridge, determines the mun to a good and worthy net,
we will suy, or a virtaons course of conduct? The inwelligent will or the sulf-determining power? True, in
tell part, it is ; and the will is pre-eninently the spiritaal constituent in our being. But will any man admit that his own with is the only and sufficiont determinat of all he is and of ull he does? is nothing to le attritated to the harmony of the system to which it belonys. and to the pre-established hitness of the oljeets and ugenty, known and unknown, that surround him, as neting on the will, though douhtless with it likewise ${ }^{\text {f }}$
The whole qnestion, however, is involved in diflicultios The whole question, however, is iuvolved in dithicultios
which daly onr limited facnltios to eolve. "llow the which dely onr limited faculties to eolve. "Now the
will can puseibly le free," enys Sir W. Hatuilton, "nanse will can pussibly le free," enys sir $W$. Hntailton, "nanst
reman to $n s$, under the present limitation of our tacnireminin to $n s$, under the present limitation of our fion of
ties, whally iteomprelhensible." "The assertion of aboinute nuesssity is virtunlly the nogation of a motal universe, eonmequently, of the mory have heen better," he siaid, in kpouking of the view of the question as taken lyy the scottisli nehool of phibsasphers, "t to whow articnlint ly that liberty and necesoxity are both inemmprehensble, and toth heyond the limitsot legitimate thought; but that. though the free ageney of tann canaut be speculatively provel, ro neithrer can it be mpeculatively dinproved, whilo wo may clation for it, ats a fart ol real metmality, though of inconcedvabte
punsibility, the togtimony of consrionsuoss, - that wo panmibility, the tratimony of conscionsuons, - that wo
arce moratly fros, as we are morally nceomatable for onr artions"
Free-wonanais, $n$. A woman not enalavel.- 1 Mfac.II. 11 Freazinble, a. That may be frozes.

cold at which water congeals; to chill: to stagnate, ne op. $a$. To congeal; to harden into ice; tufchange from a fluid to a solid form by cold or abstraction of heat ; to kill by cold; to chill; to give the sensation of cold and ner: as, a freezing louk
Freez'ink, $n$. (c'hem.) The solidification or congelation of water or atmospheric vapor by cold. Water hegins to freeze whea the temperature of the atmosphere is $32^{\circ}$ Falr., at which point ice begins to appear, and contine disturhauce of to be ferms some circumstance, snch as the disturhance of the water, interferes. As the cold perature at which water congeals, begio to freeze tempass into the solid form During spring sid the and months of enmmer, much harm is done to vogetation by frost; and duriog severe frosts almost all seretables fall ioto a state of decay, and even a moderate frost is able to destroy tender plants. When there has leen much rain, and when the plants are satorated with moistore the occurrence of a frost is very disastrons; for as the water contained in the leaves begins to freeze, it expands, rupturing the vegetable fibres and destroying the plant. Froits nre destroyed by frost in a similar manner. When the nortugg dew freezes. it is called and antang. A* the air begins to he warmed by the rising sun, the evaporation from the leaves of the plants, and shruls, is accelerated, aod the cold io creased; hence the moisture which was only dew hefore the dawn, is often converted into hoar-frost shortly after sonrise. The disastrous effects of frost upog vegetation can only the averted in a very limited meoder. That which will protect a plant from dew will protect it from frost: hence a covering of network or thin gauze will protect tender plants or the blussams of wall-frnit. The most efficieat node, bowever, is to shield the plant from the clear bky, and thos prevent the radiation which most

## Freez'ing. $a$ Con

reezing, $p, a$. Congealing with cold.-Chilling ; cold. are frozen artificially. The first apparatns of the kind was one invented hy Sir John Leslie, by neans of whith liquids were frozeo in tacue. When the pressure of the otmosphere is removed, liquids evaporate manch more rapidly than under ordinary circumstances, the heat prodncing the evaporation existing in the liguids themselves. When, therefore, a guantity of sulpharic ether is placed in $n$ vesed under the recenter of an air-pamp, and in it is placed a vessel containing a small quantity rates rapislly aud in su do reciver, the ether evapoof the water, which is soon converted into ive. heat introduced into the receiser a slullew wesel cuntuinie highly concutrated sulphuric acid, ubove which was placed another vessel coutaining water when the air was alstracted, the water evaporated rapidly, and its vapor, on account of the strong attraction which snlphuric acid bas for it, was immediately absorbed. In two or three minutes congelation liecan. Sulphnric
acid is not the ooly sabstance capable of prodacing this acid is not the ooly substance capable of prodocing this
resnlt; any substaoce which bas a strong attraction for result; any salstaoce which bas a strong attraction for
water will do as well. The principle, generally, is the water will do as well. The principle, generally, is the production of cold by evaporating volatic the condensation of their vapors hy pressure, and the continued re-evaporation and recondensation Masine is said to be one introduced hy Mr. Moldeng the manufacture of which was commenced upon an extensive scale is Philadelphia, iu 1877 . Mr. H. employs a current of cold water to reduce the heat cansed by recondensation. The machine consists of a refrigerating eylinder, covered with a non-conductur. It is jotirnaled on a shaff, provided with radial arms, which carrying upon their outer ends longitudinally arranged rils, around these ribs, and near the inner periphery of the cylinder, is Fonnd a continuous eoiled pipe, in which cireulates liquid, which is received from a coovenient tank coll of pipe extends the entirelenath of thecyliuder and at earh end eommunicates with the hollow ends of the shaft, and throngh this hollow with a snpplypipe and an exit-pipe, so that a contluuous circulation of the nom-consealable liquid may he kept up in tho cril. Iuside of this cylinder a volntile liquid is placed, which may be cther, chymogene, ammonia, anhyilrussulpharous oxide, or any other easily evaparatied liquid, which is introduced through a pipe, and is maintained at such a level as to immerse the bottum jurtion of the coil of pipes, As the coll of pipes is revolred hy anysuitahle mechanism, fhe coll pasus to the upper portion of the cylinder with its sarface moistencd hy the waction fad, his the erl inder is exhamsted of its gasmonts contents through n pipe, by means of pumps, the evapuration of the figuld upon the surface of the coil rapuidlytakes place to supply the partial vacuum, und a corresponding cuntained velicle of non-congealable lipenid takes place. As the gas is erhansted from the cylinder, if passes to the pumps, from theuce to a condeuser, and theneo through a pho as lingid to a reweirer. Tho thecylinder through nplys. The elrculatingofliquld (whited through in circulating pump, and the whole uprested by an engine. A largo portion of the fee
consumed In the south, is nade by fruexing machines.

 yand 4. an trituty
of time these two became in some measure bleoded, the Latin elethent remaining the nhore prominent: and this ed into tro branchers, which touk their respective mades of expressitat the word yes. The VisiGoths nud Burgundians S. of the Loire said oc (Latin ac, Ger, aach, also) for yes, while the Franks and Normans
to the N . said oil; sud hence the dhlect af the former was called la langae doc, und of the latter la langue d'al; the former of these, which came deceive the wame of Procenfare fromeladed the whole of the $s$ of Fhance, was characterized rather by a modification of France, was characterized rather by a pordin words, that hy the admixture of foreiga words latin worls, Thongh manch changed, it is atill the dislect of the common people it Provence, Laguedloc, Catalonia, thencia. Najorea, Mnorca, and Sardinia, Less troubled by wars, and of a more gay and sprightly tnrn of uind, the languags of the Suutherns speedily became pulished, azd ite glery was spread over Eurupe by the
Bhbors of the Troubadours. Tine dialect uf N. France habors of the Troubadonis. The dialect of N. Fance had a much greater admixture of the dermanic eleorent
than the S., which was etill further augmonted by the estahlishment of the Normans in that part, in the begianing of the loth cent. The Trouver res of the N.. at a later period. in their rader tomgue, followed the example of the Troubaloura; -but while the latter bang the and chivalry. After the commencemeat of the Crusades, both languiges approached towards a futiod. The cruel persecition of the Albigensts checked the deven of the political rule of the N . southwards hrought with it the language of that peuple. The real French langunge began to be developed about the time of the conquest of Constantinople by the French Crusaders, at the beginmmg of the loth cent. Froissurts chronicigs, - Yrench whach is quite intelligible to the otudent of the present day. Francis J. greatly encouraged the development of the Fredech, anil substituted that lansuage for Latin in puble ranuactions. Ralulais greatly eoriched it. Kansird and bll Bellay, Anyet and Montaigne, and others, developed it still further. The religInns reforms, politicnl tronbles, snd the influence of the Italian wars and queens, modified it greatly. The intruderetion of A rabic words is chiefly dne to the Crnabdes; and of treck ant Litin words, suit of ecieutibc terus,
to the study of these laoguages and to the cnitivation to the study of these laognages and to the cnitivation
of the natural soliences. The Academie Vrançaise, estatlished by Richelien for the regulation of the mational lashed by Re (1635), the influence of the court, the labors of the Port Royalists, - esperially Paval (1656), and a pulaxy of preat writers, - purified, augmented, and diffused it more and more. It was nist usednea (16is). The French is the most generally known of all languagrs among civilized mations; and many illnstrions torelgners, as loilmitz, Ilumioldt, Gibbon, and sir William Jones, have writu'n sume of the norke in it. It in in very clear tongue, on acconnt of the compeosition of words atrealy tixed, as well as of boll poetic turne The Fronch lingrage, in short, is like every other, the culture, umi taste of the people that apeak it. The enrliest literatare of Friace is that of the Troubadours and Tronveras. The formur thontished noost during the 11 th and 12th cent. Their productions were chicfly short Iyrical effusions on love, or matters of trifling import,
and they exhbit latele phay of the imatimation, Dittle dopth of enastian, and very slight tracers of learning The Tronveres, on the other hand, in their narrative jusms known an Chuasons de geste, and written in the enirgetic hangued'ou, treated of दreat nutional subjecto. kmilith. Some of their compositions, especially the earlour, have a strikiog character of grandeur, which may rometimes he nut unfivorably compared with that of than ancirnt "bic powas. These chanstms de grate, uleo called romances, are very numserons, and hate beenclassifted into three cyclen, bearing respertively the mance of Charlenaigne, King Arthur, nud Alexander, -the first celoberatimg the deeds of the great Fraukish em-
peror, his desicendiuts nud vissals; the becomet comperor, his descendants and vassals; the becunt come
 warriors; the third comsisting of poems in which "Verite in the hathe are strangely
 gorieal pueni if erpally vast proportions, sume of Which enjoyed unparalleled pupularity: kuch ias the
Roman de Rrnard, and the Roman de la Rove. The Eormer is the will-known story of "Ifeynaril the Fox, " the Reinecke Fleche of thet thermine: the latter to a

venture, often containing a great deal of wit or fun, be generally satirical in theircharacter; they sre, howSongs were not nesherted. hy a coarse licenthusbess. Abelard, in the 12th ceatory, enjoyed a wide popularity. The progreas of prose was slower that that of poetry but the 13th ceatury presents two specimens, elowing that it had already urquired a certain degree of power aod polish. These are the Chronicle of the ('nqurat of Cbmaud simple Life of S. Loars, writteo by Joinville, whotelis us of the heroic deerls and private tirtues of the pued kne, whom he had accompanied to the Holy land. Ia the latter half of the 13th century we also Find some tolerably good specimens of the dratma is the Mysterie and Sioralities of that period. The whole of the literatore of the 14th century culominates in F'roisaart's Chrmiclen, which present the liveliest picturee of socicty snd maaners dariag that period of wor uod gaflant enterprise. The greatest writer of the 15th ceutury, also a chronicler Like Froissart, is Phalippe de Comines, who in his Memaires prezents a striking delineation of the same period also belong two of France's distioguished poets, who, strange tosay, present a striking contrast to each other in their ontward circumstancer, - the ote the princely DukeCharles of Orleans, the other the low-bred and lawless Villon, a strange cubapund of villany and inepiration. A new epoch in the hatory of Freach literature begins with the reign of Fraucis 1. (1515). The sthdy of the greek and homan suthors buw began to prevail in France; and writers, dazzled by the hitherto anknown brauthes of the ciassical writers, despised the works of their forefathers, and applied themselves to Modern Clussical soboch while that whiche somed juitatiog the ancients, derived its materiale from ontional clements, has beca dexiguated by the appellation of "Ronsutic." Tulerably free fron the classic element are the works of Clement Marot, the preatent French poet of the reign of trancis 1 .,-while the leuder of the hew or chassical nchool was Konsard, an suthor long extulled far above his merits. A host of other whiters characterize this century, chief amming whom are fabe lais and Montaigue. In the lifth century Matherlie appeared as the reformer, or rather the regulatur, of poe-try,-a ama of lastidious taste but bugere imggiuation, drucing in its stead etyle of srabumutical carractroxe and dry elegance, which eunetime reachel puruwity Balzac devoted his attention to the improvement of prose, and his acroi-philusuphical works. esuecially bis byizlles, were valnable at the time as models of careful and harmonons etyle. Snch were blso the finvolons but witty letters of his fifiend Visiture. In li3\& the Frebch Academy was instituted, under the anspices ot Cardinai Richelien, "to estahlish certain rules for the French language. and to matke it wot only elrgant bul capalase of trwabing all matters of urt ann science. Tliree writers of this period enriched Freach fiterature with important works, Pierra Corneille broupht thagedy toudegree of grindear which hae net been eurpasurd: Le Gid, Horace Ginna, and $P$ ilycucte buing among the hest of his warkn. Deseartes, ill his Discours sur la Méthoie showed that the French language was equal to the highest philosulilcal subjects; nod Inscal, in his Lettres Prorinciulen, in which comic plensantry and vehement eloquence are happily
blended, hirst formed a standurd for Freuch fore. Such whe the opering of the splenild ifterury epmeh which is gencrally etyled the "Asegr Lonis XII.." and which is distimguished by a galaxy of superjur intellepts, who, nnder the royni patronnge, npplied themsplyes to per: fectiog every bratach of literatire. Foltaire, J. J. Roussean, and Buffon. Montesquiea, a writer of great force and brilliney, and on hater hy pub-
 lishny Les Lettrrs Prranes, intachions princijud works, institutions, und even religion. sur primigudrar ol las Décudence des Romains, and his Exprit drs Lons, un athe and profound disiguistion mpon general leghsiatton. Foltaire, the trne personation of his ago ith dhspomition, is woll as io talents, was for half a century the leater of public opinion io Framee. Ils womiterg verstes of enabled him to treat sbecessfully ninust atorathistory, fiturature - tragedy, satire, rotuates, poetry, houserats and philosophy. The passionate elongence of when he naude him bo was anst civilization, und attweking whe decial order of thinge. Buffon occupied is less akithe sod splere devoting himselt to the stady and descriptive of naturo; aud ly his Ifistoire Niturelle he introdive of a naturo; ara in the study of natural histury. Diderat and D'Alembert finnded the Encyclopectic, at vast review uf human knowledge, but always losttlo to re ligion. Itelvetius, ith his treatise DC Lespri, Def by buch, in his Systame de le Nulure; and Lothetterie, ly his L'Homm Machine, and La lie heareuse Sonejw, tur excceded the encyclopedists in the dentructive tenamery of their doctrints. Anwug the few Vernet. Among the religion during the perwe was place is due to Condillas; metaplysical writers, Geneva ull of whom remained on the side of mustoration, and gavelittle support to the tembencies of the nge One of the must learimed historians of that perrod was Mibly. Charles dos Br.kses, Gognet, Burthenoury, Rity nal, De Melscgata, Velley, aro also manes of note in thas department. Tou matheustical and physucal sciences m.de great progress in Fratice dario bgraseo labande, as wituess the names of D Alembert, Ligrango (adimimo Lacaille, Maupertaid, Clairant, Lemosbuer. Condonam Charlea Bennet, Brissot, Vica dizyr; Jussien in botany Charles Bennet, Brissot, Viog dazyr, dity the drama, and and Sanssare gineral hiterature, woth tratic poits; Le Sage, nuthor of Gal Blas and of Farcuret, perlays the beat combly atter de Seville; Jeruardin de St. Vierre, author of Fuul et Virginie; St. Simun. wheso Mémires hive gamed a di-
served celebrity; Marmontel, tho author of Belisclire verved celebrity; Marmontel, tho author of Be Rolaand Lebrun, the lyric poet. The wis by mo mesas fivoratile to literature, and little thon wha by mates mas the empire which succended. Madame su Watael and Chateauteriand were the forerimber of is revival, which was. perhaps, less owing to thei works, than to the influence upon pabicanse, which fonad mure and wore adourers in France. A new r mantic schoul now sprung op, and, thiters, new life w: infused ioto unarly every krioch of literature, puetry, history, philos phy, aud the drama. An acimated co troversy wis mantaibed between the supporters ond the form anol the idlserents of the classhat schooric Sunlic. cantest renched its utnust fury when fred Vicion, and Alexandre Dumas, Victor tugo, Ams framed accordio thers, prodeas of the Shakspearean style. It was only ther several years that the younger body of combat ants cane oat victorions. Novels which, during the e citement of the contest, had been scarcely nuticed, came the rage suon after it was settled. Gearge sor (M vame Dudevant), obe of the must elegather Indiana, which appeared in 1812 , and has siace published mally popular works. Alexacdre Duusts, the itu xhaustible romancist, has woo imeleuse popnlarity by his work Les Tronis Mousquetaires, Le Combs de also obthined greal numerons other works. Engene Sue as of Piris, und $L$ pophiarity by wis wurks Les glatimy colors the miseries sud depravities of suciety. Aranng other distunguished writers we may mention Hotwre de Balzac, Frédéric Sonlié, Alphonse Karr, Alfred de Mazact, Prosper Meri neee, Badame Emile de Girardio, Theophile Gamtier Jules Siadeau, and Emile Souvestre. A netr genew yars. of atory-tellers has beeu risiog withint to be compared who. though their powers are scarcely to be comes. no with thugi of their predecessoms, beloge to what they devoid of talent. so meatisti- chools they are Heai theluselsed call the realistic rchomb; they are fica Iurger, Alexander Fola. Octave Fenillet. and Edmond eydean, Puetry is far from treing as popniar in Frinc as the oovel, and the country has protuced bat few great yurts during the present century. The fonr greates Fyrics are Béranger, Victur IIago, Lamartine, and Allre de Masset: besides whom, Casimur Delavigne, August Burbier, and Victor de la Prule are the only names re quiring to be mentioned. History is, unch litenture. A larger aumber of valuable listorical works have been published withiu the last fifty years than daste for such other equal period of its history, and the s. Guizot, the great philosophical expounder of accial institutiotic, 3le Ages, stand forernost among the promuters of thim movemeot. Sismondi, Michelet, and 11 enri Martin have each devoted their efforts to a mall recital of givIng is his Histirire des Ducs de Burrgngne (18:24), an at
tractive specimen of purety narrative history, has fe cenily puthinhal thisf-irs of the cimention und the oh
 aftention of buny lastorians; anong whom the man
 Bhanc. Lamurtine uko figures atholing clase, whech baving proiluced severa, mable for there thow lauguage than tor thear accuracy or research. The elogant und accomplished villemuns, althoughs better known in the field ot general liternture, has almo ptotucod metroid his turical works, ws has flisture de Cronwed, Bma his ans ners (sintemporuins. As a lecturer and a chitic, moman

 ology has not becn Mughe Ruchette, unl Beuté. Clana pollion, Sylvestre de Sacy, Ernest Koman, and Abol de liemnsat, have thrown great liyht upon Egyptan and Oriental langargeo and interntare. FRIE
our boly mediator and intercessor. They have uniformly declared their belief io the divinity aod mano hood of the Lord Jesus: that he was both trae God and perfect man, agd that his sacritice of himself upon the cross was a
propitiation and atomement for the sios of the whole propitiation and atonement for the sios of the whole of, is only to, and by virtue of that which any partake of, is only io, and by virtue of, that must satisfactory
acrifice. They believe in the Holy spirit, the pronise of the Father, whom Christ declared he would sead in his name, to lead his followers into all truth. A manifestativa, of this Spirit is given to every man to profit withal; that it convicts for sin, asd, as obeyed, gives power to the soul to overcome and forsake it; it opens to the mind the ayysteries of salvation, enables it sav ingly to understand the truths recorded in the holy Scriptures. They believe that the saving knowledge of Grud and Clurist cannot be attaived in any other wity than by the revelation of this spirit. But while the So ciety halleves the lust aod undone conditioa of man in ble for Admais sin, or that we partake of his gnilt, ontil we make it onr own by transgression of the divine law. As many as rebist net the light of Christ Jesus, but re ceive and walk therein, it becomes in thema a holy and spiritual lirth, bringing forth righteonsness, by which holy birth, viz. Jex1s Christ formed within us, and work ing hid works in us, as we are sanctitied, so we are jus
tififed in the sight of God. Therefore, it is not by our works wromght in our will that we are jnstified, but by Christ, who is both the gift and the giver, and the cause producing the effects in us. If justrication be consid without us, in the prepared tody, por his work within nos, by his Ifoly Spirit, is to be excludell; for both have their place and service in our complete justification. By the propitiatory sucrifice of Clarist without us, we, truly repenting anal believing, are, through the mercy of God,
justified from the imputation of sins and by the mithty justified from the imputation of sins; and by the mighty Work of Clurist within us the power of sin is destroyed
The Society of Friends telieves that there will be a res The society of Friends lelieves that there will be a res
urrection both of the righteons and the wicked; the urrection both of the righteons and the wicked; the
noe to eternal life and blessedness, and the other to ever noe to eternal life aud blessedncss, wav the other to
lasting miscry and torment. $F$. have always believed
that the holy Scripture that the holy Scriptures were written ly divine inspiductrines relating to eterval life; and that whatsonve doctrine is contrury to them, is to bo rejectell as false: that they are a declarstion of the will of God. Thongh they do not call thera "the Word of God," bedieving that epithet upplicathe to the Lord Jessod, yet they believe
them to be the worls of Gord, written hy holy men them to be the words of God, written hy holy mea us
they were moved ty the Iloly Ghost. As there is one Lord und one faith, so the ere is but one laptism. of which the water-baptisa of John was a figure. Kespectiog
the coummunion of the lody and blood of our Lord Jesus Christ, the Succicty of Frienls bulieves that it is in ward and spiritnal. They beliese that worslip must be in spirit and in truth : an intercourne be-twcen the soul and its great Creator; it is their practice tils sit down in solema silence th worship Gom, that each one may be en-
garged to gather inwartit to the pift of divine grace. In relation to the ministry, they hold that the authority anul qualitication for this importhant work are the npeciat gift of Christ Jesny, leestos ed both upun men and women, and munt be ruccivell inmecliately frum him, through
the revelation of his spirit in the heart. Viewing the the ravelation of his spirit in the heart. Viewing the
conomand of our Savionr, "freely ye bave received, comanad of our savionr, "freely ye bave receivel,
freely give," as of listiag obligation upon all his minisfers, the suciety has, from the first, stealfastly mainthined tho ductrine that the guspel is to be preached withont money and without price, and has borne a constant testimeny against a man-made hireling ministry, which lerivers its gualificutom and wathority from human learningund ordinution. The society of Friends believes buspel, which contimanlly breathes peace on earth num goon-will th men. In the same mamer the Society bolieves itell bound by the "xpress command of our iond,

The Members of this party olitianed the derisive name of Prondeurs (slingers), from the pertinacious lnmpoon
warfare which they wnged ogainst both the powerfal Warfare which they waged ogapst both the powerfal
minister of that day, Cardinal Mazazil, and the Queen minister of that duy, Cardinal Mazmin, ads the Queen Regent, Anne of Auntria. Mazarin, ns a foreigner and a parbrnu, enjoyed the detestation of the French peo fiad incurreal the opposition of the Parliament of Iaris to his mensures. In 1648 Mazarin ventured on the buli atep of arresting two of the Duast papular members of the litter body, and on the next day (la journée des barricales) the Pariaiand rose in urms, dispersed som of the royal troops sent out against them, and barricaded the appronclacs to the Louvre, compelling the cour party to retire to St. Germain, nnd thus Jeasing Paris in the hands of the insurgents. Upou the Prince de Conde advancing to bexicge the capital, the parlinment called
the citizens to armas, when the Prince de Conti, the citizens to arms, When the Prince de Conti, the Duc de Beanfort ("Li-kna dilles, and eron of fenry 1. .) dom, came forwimal to head the insurrection. The kimpus Cardinal de Retz nlss joined the movement, nor wis branty wanting, in the persons of the Duchesgen the Longueville and de Monthzon, to inspire the pupolur canse. The Prince de Condé, too, changed sides and wunt over to the malcontents, with whom the conrt jurty shortly afterwards patched up a treaty of peace of lat brief daration. Frimh contentiona anose, and Nazaria cansid tie nerrat of Conde and Conti, two of the princen of the blond. This atep on the part of the hated Italian excited a revolt in the provinces, and Marshal Turenne rented in the battle of lethiel (1650). The Cardinal, however, enjoyal bue m mere temporary eupronacy: the parlianuent usain agitated againat him, and poucured hit baniahurnt front france, leaving the I'rinco the Conde manter of the siturtion. Subspquently, the content the generateil into an war os intrigue. Some of the F'rondent lendors were inflienced by the gueen to desert their jaity, and others nari bonght over liy the cardinali gold. V'itibiately, all furtios belug wearind with these dinscuabins, the court agrecel tor remove Mazarin, athl n

A kind of sieve
, an English philanthropist and prison Fry, Eldztaet 1; 80 , was one of the Gurney family. the retormer, B. brak, was one of the Gurney fand merchants of London and Norwich. The Goraeys belonged to the Society of Friends but without confurming to the etricter principles
of that persmasion with respect to costnme, form of language, end 60cial usagee. Eliza beth Gurney, accordingly, in the earlies part of her
life, freely parlife, freely par-
took of the gayeties iocidental to the circle of life in whicheite
unoved. In 1798, how ever, as William Savery, theo travelling in England on a re ligious oniesion,
preached in the preached in the
Friends meetingFriends meeting
 hothes at Norwic 5. Gurney formed one of his congregation, and became so influenced by the preacher's diseowrse, that she determined to change ber mote of life to that prescribed
by there rigul and orthodox of the sect. This clangn was consuramated by her marriage, in 1800 , wish Jobeph Fry, bitoself a " plain Friend.' In 1810 Mrs. Fry joined the ministry, and thenceforward devited herseif to offices of the purest begevolenceand jiety. Owing to her anwearied exertiods, important reforms were effected in the prison systems, not ouly of Great Britain, but also in thuse of France end Germany. After years of indefatignble lator among the poor

Fi'el, $n$. [O. Fr. fuayl; Fr. fru: from 1at. focus, a hearth.] Any combustible snlust.ance which is useet for the prodnction of he it constitates at species of fuel, and on this extemded seose of the tlerm, oil, num other inflamme lmodies which ari cual-gas, oil, ani other inflammabe madies which ary as sururces of heat its well as light, might be inchnded under it. But the term furl is moge properly limited t., coal, cobe, charcoal, wood, and in few uther substances. which aro our comanom soarces of hed, and as sach are burnt in grates, stoves, tireplices, and farmaces. 1n his comntry, as in Englaat, cond, from its almudance and cheapuets, is the fael comannly eaployed; bot in other comutries, ar Erance, Germ anv. et ., wood is much ased, either in its original state or in the form of char coal. But whatever substanco the nsed, the egsent and the heat which is exolved by their combustion ix derivell from their combination at high temperatures with the oxygen of th- air: the principal results or products of this combnstion are cartroaic acid and water, these escaping into the atmosphore by the fine or chinney generally attached to furnueet and fireplaces. It is essential to gool and profitale fuct that it should heat which it sencrates is consumel in converting in moisture into vapor: hence the superior valne of ofd dense, and dry woul. to that which is poruns and damp; hence also tha greater quantity of heat evolved during wood, for even the dryest wood always retains a certain quantity of water: hence also coke gives ont more heat partly becanse during the combastion or heatiog of coal tar, vil, water, and inflummule guses are evolved, all of which carry uf at curt un proportion of the grat
io a latent form. The different kinds of pit-cral give out variable qustities of heat dhring their combus tiou; upon an averaze, one pound of coal should raise 60 pounds of water from the freezing to ita boiling point The heatiog powur of coke as compared with cual is neariy in the ratio of 75 to 65: a pound of good coke
heating from 64 to 63 ponnds of water from 320 to 21,20 The value of irned tarf and peat as fual is liable to much variation, and depends patrtly upon their density, ani partly upon their freedom from eartlyy impurities. $3{ }^{\circ}$ to $212 \circ$, and a punad of dense peunds of wabont 30 pornuls by compressing and itryiog peat, its value as a melis greatly increasel. Ths following table, by Dr . Vr shows the quantity of water rajsed from $32^{\circ}$ to $212^{\circ}$ by one pound wright of the different combustibles enumerated in the first columa; it ulso sbows the number of pounis of boiling water which the samestic Intely consmoned during conbustion.

Fulimimate, $r, n$. [Fr. fulminer. See StPra] To lighten sud thunder; te make a loud, sudden noise, or a
sudden, sharp crack; to detonate. - To isene forth ecclesiantical censures, as if with the force of a thunderlolt. $-v$. $a$. Te utter or sendout, as a denuaciation or cenaure. -To cause to explude
Fulminale, r. [Lat, fulmen, a thunderbolt.] (Chem.) A compund of fulmioic acid with a base. They are all more or less explosive by the action of heat or friction
Of these, the F: of mercury and silver are the must important.
F: of Mercury (Chem.) is prepared by dissolving one part of the mercury in 12 of nitric acid, sp . $\mathrm{gr} .1 \cdot 42$, aided add 11 jarts of aicohol, op as the mercury is dissolved, ensue, and the solntion will become turbid from the separation of crystals of the fulminate. Depse whita clouds are also evolved nt the same timie, which have an agreeable odor from the presence of nitrous ether, aldehyde, and other prodacts of the action of nitric acid upon alcohol. When the action has subsided, the vessel tuay be filled with water, and the fulminate allowed to settle, after which it is collected on a filter, washed and dried by exposmre ta the nir. When dry it mast be hatudled cautiously, as it explodes by friction or percussion, especially when in contact with particles of sand or glass. It must be kept in corked bottles, lest it be ploded by heatiag to sbont and stopper. It is also exand by contact with concentrated nitric or snipluric, acid. This fulminate is used lur the filling of percue siod-caps. For this purpose it is necessary to moderate its explosive property, since it is too rapid and violent for the purpose. it is mixed with chlorate or pitrate of potash, and ground glass is often added to increase the sevsibility of the Dixture to explosion by percussion. The composition is made in but small quactitien at a tiare, sioce it is so liable to explole uuder friction. After being placed in the cap, it is made to adhere and rendered water-proof by a drup of the solbtion of shelllac in nlcohol. $\mathrm{Finm} \mathrm{C}_{4} \mathrm{C}_{2} \mathrm{~N}_{2} \mathrm{O}_{4}$
for $F$. of mercury, luput as ife a process similar to that for $F$. of mercury, lut as ife explusive properties are
far more vinlent, it is advisable to prepare it only in far mora vinlent, it is advisable to prepare it only in the greatest cantion. Nothieg berder than paper should be ased in manipalating it, and it shauld le kept in small quantities wrapped in paper in a card-board box. It is ueed in detonating crackers, which are made hy wisting up a particle of the $f$. in a piece of their paper with some fragorents of crushed pebble, If a particle of the $F$ : be placed on a glass plate and to ncher with a glass rod dipped in snlphuric acid, it will detomate and of thia $F$. may he compared with that of mercury heating equal quantitics opon thin copper or platinum foil, the $\boldsymbol{F}$. of mercury will expleale with a slikht porf and not injure the foil; that of silver will given loud crack and rend a hole in the metal. (q. r.), the fonnder of the caasl system of Great Britain of monduced $F$. to abaadon art, and take to the study of mechaoical science. This nobleman was at the tim eagaged in a seherae of steam-naviention, whach he imparted to $P$. The latter visiting Burminghan was W.att ( $q . v$.), who hanl jnst succeeted in his great improveWatt ( $q . v$.), who hanl just succeeded in his great improve-
ment of the stesm-cagine, with the construction of which $P$. made himself thoronghly fumiliar during his stay. About this time he invented a machise for spionigg flax, and anothor for making ropes, for which he treatise on the improvement of canal-navigation. From 1797 to 1 N0t he resided in P.uris with Mr. Juel Barlow the American represeatative at the French court. During this period he invented a subnarine or plunging
boat, called a Torpuln, designed to be used in nual warboat, called a Torpoln, designed to be used in nuval war-
fare. He invited the attention of the French governfare. He invited the attention of the French govern-
ment to his invention, and Bonaparte, then First Consul, ment to his inveution, and Bonaparte, then First consion to the harbor of Brest. Ile conlli easily deacend to 1801 depth. or rise to the surfice; null where tiere was no etrong curreot, the boat was quite obedient to her helm while noder water. On one occasion, he remained in the torpedo several feet below the surface for more than four honrs; but the motion of the boat while submerged was very 6 low, aud it was clearly nneqnal to the stem-
ming of a strong current. The Frencb government de. ming of a strong current. The Frencb government de-
clined to patroaize the project, and $F$ accepted an iovitation from the English ministry, who also appointed a commission to test the merits of his torpedo. He appears, bowever, to have received but little enconrageHaviog been sapplied with the necessary funds by Rub Haviog been supplied with the necessary funds by RuthParis, $F$. had the satisfaction of proving, is J807, that steam could be applied to the propulsion of vessels with entire success. His achievement excited universal

Fire-tlamp. (Minim.) A new upparatus fir dotect ing tbe presence of hire-danop io mines has leen re-
cently introduced in Gertuany, which is thas descrilud cently introduced in Gertuany, which is thus descrimed
1t consists of a bell actuated Ly cluck-work, the strikink It consists of a bell actuated ly click-Work, the strikim,
wotiou being cluecked by an unevenly lularced arim the lighter end of which is held by a cotton thread saturated with saltpetre. The apparatus is phaced in a wire-gauze cage. from contact with the flume of a lannp burning within atid, as a yecessary ceusequence, burbs the throwi, ent ting free the balancel arm which checks the bell, which then rings the alarm. This device seems simple, unt may le easily tried.
Fire Millo. in Alabamn, a twp. of Hale co
Fire-proof hinibliass. To make a building en tircly proor asanst the destrnctive action of fire wonl
seem, from the disastrons result of the recent Chicag. seem, from the disastrons result of the recent Chicage
and Buston coodagrations, as manifestly inipracticable;
 that are either meombastible or guffer less that others from the action of heat, and by paying proper attenthon to the construction of the byitding and the ar rangenent of the materials of wheh it is compused that no wrod-work, if timber be nsed in it, nury b placed near enough to gas-pipes, or pires commamfrom explo hating mytrat canse. All materials ma he broadly clasified us coulhnstible and incombustible iocluding, under the former term, all kiuds of wood which fire will entirely coosume; and under the latter bnildigg-stone, brick, cement, and metal. which canno be completely destroyed by fire, although the action of heat may exert considerable inflvence opon them. and mahogany, or any mort of hard wood, will not burn as rapudy and freeiy as deai. Of stoncs, some are more liable to iajury from heat than others; llmestene, and eveo granite, will crack and fly to pieces if cold water be suddenly poured on then when is a beated state; but sandstone seems capuable of offering mure effectual resistance to the action of fire than limestonc, and therefore better soit d for fire-proof buitdings. When iron 18 nscd for juists or girdire, it muse be remembered
that it is lialle to contraction and expansion under the that it is liable to contraction and expansion under the influence of beat and cold, and that cast-iron beams whil break if sudud Whea red-hot, and that wroug haron gurners, wa the Eanperincumbent weifht, In constructing a fire-proor lunding, that is to say, a bnilding in which un out break of fire will be attended with jess destrnctive conseguences to the bnilding itself and the gools contained io it, that in one erected in the ordinary way, it is bunifest that the use of conbonstible material 6 must be alandoned as much os possible, except for interior fit tings, and to form linings or wainscoting for chambera used us apartments, tu prevent the incoovenietice likely to arise if the walls ehould be cxpused to any great heat, hecanse stones and metals are good conductors of heat, and wood is a non-coudpetor. No building ca fire in the interior, bowever well adapted it may lie t fire in the interior, bowever well alapted it may he to
resist fire externally. It is always found that larte warehonses, in which great quaitities of goods are stored, offen suffer considerably, or are almost entirely destroyed, by the effect of fire in the interior. This might be counteracted, to a certain extent, hy storny inflammable goods and materials linble to spoutancuns combustion in small separate buildings, or in isulated compartments; care heing taken, in their construction,
to prevent the communication of fire, breaking cut in to prevent the communication of fire, breakigg out in
one part, to any other part of the buidding; for a larem nass of fire in a brilding of great extont will do far unre danage, is proportion to the bulding itspld, than
 eons that are evideut. To reoder an urdioury building
for commercial purposes, tolerably fire-proof, a stons staircham should be conatructed, thintene mene of coum as the wosten starcane is tho ofth the meats of comElunald le of brick or ntone of gend quabity - Aud recent experience has shoun in that no muterial is equal to
 composed of statis, shate, thes, or bricks, It buldang

Fonmder (Fur.) comes from feeding or wateriog when overheated. A few onouthfnls of witer or grain day
produce it, when his feet become feverish und be wall be stiff all over, often not be able to rise. Immediate bleeding is the best remedy; remove shoes and ponltice
feet with freah cow droppings, or with hran or linseed feet with freah cow droppings, or with hran or hasped
meal mixed with warm water, which shonld be changeil several times,a day. Feed theo ou greco feed, no grain, but carrote and hay or grass as much as he hiunts When he is able to take care of hiaself, turn bim int a soft meadow for a few months. $P$ often ruins a hurse
for his entire after life, and very lintle care will avoi it. Nu matter how tired a horse may be, yon can give him hay or grass for a half hour at least; there is no danger of $P$, unless he be io adratught, Sweatiog it ont is anuther repsedy for $F$. Blanket him sll over and make him exercise freely, so as to tuske him sweat freely; then put him io a close stable, free from any dratught, scrape him well and rab him, give him tepid wad whitet and swot ario. There is no certuin cure but with prompt attention either of the abore remedice may do a great deal of pood.- Whartim,
Foun'tain Infermittentio (Phymes.) The pan given to those fontatans the flow of which cases sud Como there is a fountain which, threc times a day, in crasses and diminishes; Pliny the Founger makes men tiun of it in the 3uth Epistle of his tth Brok. In Savoy on the edge of the Lakie of Bonrget, exists the Fountar of Winders, one which flows, stops, and relliws twi in an bour; when the fles is about to begid s buhblagg ides, formiur juts, the beipht of which iucreases firat, sud theo soccessively diminishes. The water, iffter apringing for seven or eipht minutes, stopy for the spuce of two. It would be easy to mnltiply similar examples. lo order to explain suth phenomena, let os suppose that a spring reached ly a pipe, or hy aby datural pits

the whole war. The lossex of the Gernains, particnries andoyed dmmentind ulvactages of phere their noversain the extreme ; those of the Fiench were proportionately hess; but as Bazaine abandoned his project of a
Tetrugrale movement, nud retnroen to bis position retrugrale movement, and retnroul to his position
noder the walls of Metz, where he was instantly henmed in lyy the Germans, the hatter must be considered to have acthieved the impicdiate purpose for which they valley of the woselle yucy was busy reurmaiz ing his corps diarmée et Clalons aud incorpurulug all the reioforcements that reached him from Paris or else where. At length towards the end of Angust, he quitted Chalons at the bead of a force mumberng atoni 100,060 nald, abd advanced by forced marclies on Sedan Weing the Emperor was awaitiug hina, the itheotion being to march thence to the release of Bazaine, whon secret agents, sent acruss thi Prussian limes, were to io
form him of Mac Malion's advance. Int MacMalion was elosely followed ly the id German army, under the latter obluce of Prussia, and the movements of the latter obliged the French commander tugive hinn liattle place a considerable body of Germuans, clifietly which place a considerable body of Gerwans, chiefly Bavariengagement lasted two days, the 3lst of Angant and 1st of September. Early on the second day Mac Muhen fell, dangerunsly wonsied, and the conmand devolveli Ont General Ducrot, who an hour after gielded it t General Wimpfen, just arrived from Algeria. This of ticer, seeing the force onder his orders completely sur-
rounded by the Gernums, and the position of Nedan rounded by the Gernuns, and the position of Sedan
conmpetely matenable against modern artillery, decided conpletely mantenable aganst modern artacry, decide the eneny s lines, and sent to inform the Eoperur of Thimely refused his asemt and ordering the white tias to hoisted on the walls of Sedan, he seat instructions to General Wimpfen to treat with the Prussian commadderat for the surreuder of the place aod the Yrench force it contained, himself and stafl included. The general refused at hirst to oley, lint fimally complied with this unexpected order; the l'russians took military 1 wises simn of Sedan, and the Ebperor and his defeated army,
of sonto 90,000 men, passed as prisoners of war behind of sence 90,000 men, passed as prisoners of war hehind
the tierman lines. - Thre news of this immense disaster the Gernan lines.- The news of this imbense disaster
for the Freoch arms reached Paris on the night of the Sor of Septeniver; the popalation, ixasperated at the previous deteats of the army and the obvious incapacity of the government, broke into revolution on the next day. A group of deputice, chicfly members for the capital, nssomed imanediately the title of "Government of the National Defence," "nder the presidency of Goneral Trochin, a sulficer of repute whon short time before had bech named military governor of Paris; the fult of the cmpire was instintly proclaimed, and a republican form of goveramest set up in its stral. Trocha's princias colleagnes in this assumption of power
were MN Jules Favre, Gazulheta, Picard, Garoier, Fatees, Gicueral Le Flo, and Admiral Yaurichon. X Pages, General Le Flo, and Admiral Kanrichun. X
arned opposition was anywhere offered to this revol tionary movement, for the lmperialists disajpented as if iy esthatment and for the first tume in Fienct history the form of geverument in France was changed bilue people of Psris withont the alightest oflusion of at Sudany the defeat and capture of Mac Maion sarm one division only, that of Gus oner Vnoy, escupang the cononoo fate, nad making good its retreat to the cappital. While, therefore, the forces of Prince Frederick Charlps, nbont 250,000 inen, continued the blorkate of Bazaine's urimy under the walls of Mretz, the butk of the
(ierman (roupe marched ranidy on Paris ; en the 1 8 th Sorman truope marched rapidy on Paris ; en the 1 sth
of Septemtwr their lure of investment around it were of septendw. their hace of investment around it were complete, and then began one of the most cdelmateod
sieres in the ammats of war. Unfortmately for the Fronch, Patis cootained bat few reknhar troops, and these were of interior qumlity. Neverthelose, Gwacmi Oherot led a portiun of the in on the thext day, the 19 h positioo behind the heights of Chatill in to caver the roul to Vermaillee, where the king of Prussia was to fix his heaulyonrters; the tho result was not encounakTng. The ticrmans, us usul, made a free nse of theit
artillery, in which aru their assailantg wern artillery, in which arus their axsailants were luewhintly
 sive measires frum within had consmmently to b athanduased for at the : the Germann proceeded leinimely a liter periond, were to bombard Paria, und the ncene of active "perathons was transferred for a time to the val
 of pewa whered soon aiter win the eide of Germany hy tho new government were necoled for the contimumace of the strugsle. Twa dele
 minaion to raire the minvaded parts of the comery anid
kive to turw heien a miltary urganization. A month
 from Maras then M. Gathbotta hat ta he divgatchea myvexted, he life hy night in a hatlown, armath with finit powers as mitulteter of war in the provincere, unt to hing
 und his munitions of war from the sco-borrd and the
sonthern provinces, he soon organized a respectable forse on the hanks of the Loire, and amother to olverat in the sorth, the ultidate object of both being the raising of the siege of Paris. Betore he arrived at by a Bavaring pors Otober, Orleans had been occupned der Tann, who hird e.sisily vangpished at Artenay an ill organized budy of French troops, under Gieneral Latm
 trombern
 head of the furces lie proceeded to orsanize behind the Loire, simultabconsly with these formations nien wore being assematied and armed io the cast of Frince, muder Guberal Canaliriels, and in the west mider Breton afficers who had recently quitied the service of the Pope. The brit gagressive brovement of the new army of the Lomre whs to be agsinst the foreer ocrnpying Orleans. Gnt it was Trearded ly M. Thiers jassage morow the country. This seteran statesman had patriotically accepted a misshon from the Government of the thi Septenber to risit the principul cumerte of Europe, in
cluding that of Russia, with the virw of nentral puwcra to interfere diplenuraly, adg the further progress of the German sume: but bu had elicited nothing heyumd barren professiuns of eynupathy, add was yow oo the rial to Verabilles to negotinte, ic poasic, an nrmistice as a preliminary to overtures for peate. But here again hie efforts wero doomed to be onsuccesstur. Whit he was engated in his enterprise there arrived at crenilles the news that Metz had capitulated, ubd that the army ubder Marshat Bazaine, Tou,hou strong, had surrendured hs prisoners of war. This moneentuns event, whether lirugght simas the seachery, incoapmene, or ancer nectsain, hirnea forces ander Prince Frmernic Clurles, wameled 250,000 men, to oprate akinst the ater French levics ; and as Strashuris had fallen on the int of Suptember, Paris was now the only remmining place of straticth whose mostance could justify a proluaration of the whar. Nor did it keeni lussible that the difance of Paris coald he mach lowger jrotrustell. Its vast puphation, exceedmg, $1,0,1 \times 1,000$ munbur, was
alroaly suffering from the rimors of the sience. and in ternal troubles inded to the difficulties of the situation for the Red Republican section chose thas very mumput, an armistico werc in pro gress, to attempit the orerthrow of the Gowernment of Sueialista mo wara former muac of Paris. Their project was frustrated by the attitule of the more respuctable National (inardh the compled with the surrender of sletz, it encouraged. as might have been foresten, Cimnt biemurek to reject the proprositions of M. Thiers, ant the neqniatimas acturdingly fell through. The failare of M . Thiers becnme knowe at Tuars on the 6ith of Nuvemicer, and pn the 9th the movement projected ly Ginubetha against OrTano, suldeuly assailed ly vistly superiar forces, wis armate Grlemax in all hante. leaving 2 now drenters and gums in hamds of the Freneti. natural effect, and the rest of the winter campaign Diay be brieny todd. To the divisions commanded by Gemeral Von det Tann and the Duke or Mechlenburg, not only meceented in trustrating the most energetic nttempts of the thefevce orgawized in the valley of the Loire, but reoceupied Orleans, coptored Tours, and finally, atter a serice of operations which extended over two montha, drove the French army ander Chanzy, after severe fighting, from the Loire first to fendone, and fibaliy westward to Le Janniry, isit, in which the Germans, puttink forth all their btrength, sueceeded iu achieving the discomfitute of Chnerzy's irmy. The mission contided to l'ribce Frederick Charles and tho forces nuder his command was thits fully necompished, lint not withont great excrtions und equally great sacrifices; for the French chiefs displayed in thas campuign on the Loire a fertihty of rebonrce and temucty of purpose equid to that of
theitiermans, aud which, if exhibited earlier in tho war, thetiermans, aud which, if exhinted ear her momplexion,
might lave modified, if not chingel, the complemer might lave modified, if not changed, the complexion
of events. But it was now tuo late, nud thenr nust of events. Bnt it was now tho
strenanas efforts prodnced no other cffect than thint of aggravatiag tbeir ill success. Through the able strutegy commanded by Bonrlaki, became separated from the maia body under Chanzy, and when the latter retreated from the right bank of the Loire, Buarbaki, who was on the left, tell back on Bourges to reat his barassed troops, There he received orders to march eastward, with the double object of compelling the Germans to raise the siege of Belfort, an important fortress in the valley of the npper Rline, and then of making aus attack npon their lines of communication with their own cotuntry. But the troops he led proved totally inasdequate fonght well, and gaiaed some advantages at Arcey and Villersexel, that were soon overmatched by the fonces opposed to them noder General von Werder, and, after sta seek refuge on Swiss territory to escape capture. - The retreat of Chanzy's army from the Loire hat left the roal to Tours open to the Germans ${ }^{+}$advance; 31. Gambetta and the other representatives of the goverument quitted, therefore, that towa ia the month ot December, and retired to Bordeaux, whichwas destined to beconic ere long, and for a short time, the ecat of the en-
twe government of Frace. - We have now to follow twe government of France. - We have nuw to fullow
the secoad German aresy, which, on leaving Metz, marched horler of Ist and Sth corps, numberiug abont 35000 men, ani was destiped to ment a pullant and not aluays incffec tual resistace from a bastily-equipped force composed of "mobiles," a few regolar trow,ps, aud some detachnents of marines, the whole commanded by General Fititherbe, and preseatimg an effective force of about $3 n, 000$ nen. The advatuce of the Germans whs unopposed till they reached $A$ miens, which place fell, after a short struggle, on the 29th of November. A few days after they uccupied Ronen, almost withont the firing of a
ehot; hut at Pont-Noyclles, on the 2sd of December, and agaia at Bapaume, on the 3 d of Jannary, they were tiercely withstood by the French, and in artercillery event the latter, deficie back namore and armery, had to before they had inflicted, as well as suffered, heasy losses in killetl and wounded. Péronae, a stron fly fortified place on the river Somme, surrendered atter a long bombardment, which, like that of strashorg, was so directed that the principal btildiogs, the hospital, and same seveuty honses were destroyed, and 500 to 60 other hooses more or less injured, while the fortifica
tions of the place remained intact. The capitulation tions of the place remained intact. The capitolation
of Peronne took place on the 9 th of Janary, and just 10 days afterwards there was fotitht the battle of St. Quentin. This event, which terminated the campaign in the North. eypehronized with as sithy mate by the Patisians onder Truchta, and ia point of fact wals inthrough the German lioes of investment. Faidherbe. after a lonir and honurable contest, whe again conjelled to retreat, and did so this time on the fortified places of Cambrai und Donai, lenving 2 camons and abont 4, (M) prisoners in the haude of the Germans, (ieteral Yon Giouben, who had rejlaced Von Manteoffel, rommanded the German forces on this occasion. It appears, on a review of this campaigo, that one object of Generat
Faidherbe"s strategy was to limit the military uperaFaidherbe's strategy was to limit the military uperi-
tions fo the departmeats of the Somme and the Noro, in tions to the departments of the Somme and the Nor the French seaports, from attack; and this olject was fully pat a stap to hostulities. Ronen liad been in the power
of the Germans nearly two monthe, but Faidherbe's morements had effectually preventel them from prose eutiog their march to the month of the Seine. - Having thus traced to tbeir fioal disappearance from the field the varions armies raised in the French provinees for the prolongation of the war after the capitulation of Sedan, we have now to revirt for a moment to the sege and fall of Paris, which last event bronght this trnly
memorable war to a close. The buginning of the fiege memorable war to a cloae. The biginnitge of the eiege
fooud General Troubu, who, as military governor, confunud Genemal Troubu, who, as military governor, con-
ducted the defence, tht the bead of some 60,0061 regar troops, of about 15,400 marines and artillery-nien who for the must part raw voaths drita from the Xurthers for the oust part raw woathe dritwa from the Anrthers National Gnards, resident in the capital itself. These
last were peculiarly ill-fitted for military service; aud
their general want of thacipline mate them in the strebsth. The list care of the governor and his coudjutors, Genumals limay and lucrut, was to equip, arm and then csesay to elfert with them the defiverance of the capital. As nlemaly mentiment, the lirst attack on the Cirmans was made at Cbatillon, with a discourag ing result; and subsquebt pat tind efterte to find a s ea flace in the peratting of the bestegers, showed that if the army of lurix was banting in suldinty the Prussian lines
wore not. But the defence was, ation the whole, cotsducted with little spintit too muchithe was lost in ithe proctastmation, und no roully kront effort was made from within the city wnthl the ent of November, some 30 werks after the arrival of the Germats hefore its to correspond with the alnor of tharis, who wae redneed tain meane of thalloons and carricr-liseons, which tre quently failed th reath their destipation or reached it too late, concerted for the 2 sth of November a sally in forceacrons the Sirne to the south-east of Paris, th intantion butug to adrance and join forces, if practicaposition and nureh raptolly fowuruls the capital fuy the position and mareh rapfilly fownats the capital ly the
road of Fontaineblenth. This latter movement was finstrated ly the army of Prince Frellerick Chamles, which firmly retained its hold on its eneny; but the Parisians, ipnorant of this. quituel their positions at the appointed time, crossed the Martw 100,000 strong, under Genctals Trochu and Ducrut, and drove bat $k$ the Prussiane a distance of abont 2 miles to Champs, V1lliers, and Champisny. Their advalue was, however,
arrested lyy the strong position of Cenilly, and after arrested ly the strong position of Coenilly, end after
waiting 2 days in vain for the co-nperating force, and waiting 2 days in valin for the co-nperating force, and
repnlsing a violent uttack made on then liy fresh German troups promptly concentrated in their front, they mere compelled to remin withia their lines on the sil of Decemb-r, having sustainel severe losses in killed and menced the hombordment of Paris, and thns ageravated the snfferiogs of the already famished inlial)itant ; for, true to their pecnliar system, the beciegers
turew sbells to alanost every accessable part of the city.

Fig. 40.-trilymplal arch, de L'etoile.
On the 19 th of January the Parisians made another attack on the lmes of myserment; the point chosen wat St. Clont, their intention heing to march, if possible, on
the Prownan beadquarters at Yersailles. Lot thay were repulsed with great slanghter, and the provisions of the preat city being anw exhansted, its defence was an arbistice was concluded at Verkalles, and instant pregarations made for the election of a Leciblative Aso kembly, which, meeting at Bordenox, sloteuld assuose the revponsibility of concludias a peace. Tu satisfy a point
of bulitary hoaor, a eanall part of Paris was ofcupied of Dulitary houor, a ebatl part of Paris was oecnpied
by the Germaus for thee or four days,and the city had by the Germaus fir three or fur days,and the city had
to pay a war coatribation of two lundred millions of to pay a war coatribation of two humired millions i frages, equivaleat to $\$ 40,0 \mathrm{k}, 00$, . The elections were
effected with great celerity, nad M. Thime, who had eftected chosen deputy in 26 ilejmatments, was called by the A ssembly to the dircetion of affairs ns chicf of the Exeentive fioversment. He maintained io their respective offices the principal members of the Covernnient of the National pefebce, ficneral Trochnand M. Gambetta excepted; nad then proceeded to discniss with
 more traly, imposed, by the latter as the price of jrace. They were of extreme severity - nothing less than thi Frabce, Alsare and Lorraina, which had lyen incarporated by Lonis XIV., and the payment of a war iarlim-
 to retaio military pussoskion of a juart of France until 5 per ceut., should be paid. Gircat as were the sacrifices per cent., shonld be paid. Great as were the sacrice
demanded, the Asembly had no alternatio to th. demanded, the As-embly had bo alternatico to the Germans withdrew their forces within the limits of the
five departnents of France which they were to hold as

edts and virtites at the service of the Commune. The movement thus atausorated by the cold-blooded assassination of two general ofthcers presurved its sangninary
charscter to the end. On March-2 pacific denunstration agaiust the tendency aud atitude of the new guvernors of Paris was met by a sudicu d scharge of mosketry,
which killed several porsons and wounded many more, Which killed several hersons and wonnded many more,
and the leadera of the Nuthmil Guard opeuly anounced
 their intention the minntain,
their hold over the citnital and its inhabitatuts. Their power lasted from the 18 the of March to the 2sthe of May -a space of $\overline{\text { F }}$ days, marked by scts of the most flagh hests was tolerated, aud liberty of actiou was instantly suppressed. Shanufactories aud workshops wete arbiarms, willingly or not, in the federal ranks; arbitrary arrests were of daily occurrence, and encontagement giveu to secret debunciation. The press was trented
with peenliar rigor. Scarcely a day passed without the suppression of one or more newspapers, uud not unfe quently five or six were snppressed by the same decree. orgatus of public neus that reurained to flue ing the only wers somu half dozen wretched journals delongivg to and writted by members of the Commune itselt. Saris trates, police officers, all persons io fact connected in any way with the administration of justice, were diliclasses of men obnoxions to the Commone, the profes surs of religion were the most relentlessly huted down. Priests were urrested and thrown into pricon by dozuns; otherd were shot dowt in the streets of Areneen, a small
village under the wsils of the capital; and tlose who village under the wsils of the capital; and those who
escaped owed their safety to concealment or flight. The Archbishop of Paris, is man of eingularly enlightened and liberal views. was arrested as hostage for the lite of a socialist leader captured by the governbsent, ant senator and civil magistrate of great emmence au ex might be expected, the worship of God was opedly det rided, and llts temples ontrageonsly profaned. The principal charches of Paris were first plundered of their plate and other valuables, and theu converted intu clubphemous and idiotic talk were poured forth from the pulpit, by mon and women, to the approving andience that sat sibokiug around. For two long montlis dind
thin orgy contune within the walls of the relined eity of Paras ; but at leagth, on the 2lst of May, an army of abont low,000 men, that the goverument had bee assembling, forced its way iuto the capitad by the gate after a week of street fightiog with the Feilerals, wha futting a close to the foul and dear, it succeseding it called the Connmin toul aod degrading spectacte ful, anl the injury inflicted on the city immense. It is comphtst that nealty $\$ 0,000$ men, meludiug many of the insirrectionary chiefs, perisbed in the struggle of were shot immedatoly afterwards, for the work of re-
jressmon and pomshauent was carried out with a firm, if Iressmon and pomshaent was carried out with a firm, if
nut a cruel, hamd. As the Fetarals adupted the plan of butiblines they were campalied to abtandon the poblic some of the finest edifices and a larige number of privit evtablishtaneuts were completely destroyed. The splendid Horel de Ville, the palace of the Tuileries, that of maguificent buildar, the Dainistry of Fruance, and th and the Conncil of State, were thos consmmed, nud thei pictoresques ruins still recall the danger of utter de struction which at one manaent threatened laris.

ft at the disruption of 1843 . They refuse to be called dissenters, because they contend that their principles are those of the Chnreli of Scothaad, and that it is the Ertablished Church, and nut they, that have depserted from the principtes of the Chureh as sut forth in the Con-
fession of Faith aad the other stadanls. They nre also koown as Yonantrusionists, from the ereat primeciple against which they contended being the intrusion, or establishing, of 8 ininister in a chareh by the patron, featnre of Presbyterianoism, especially in Scutland that feature of presbyterisaida, have considerable voice in the aflairs of the Clarch, nod that a curtain amoment of deference is tu b paid to the pupalar mind. They have, ulso, nlways been opposed to any interference of the envil powers in eeclesiastical matters. The Disraption mmisters met with much sympathy throughout the country, but the majority of the notility anil great landed proprietors went with the Established Church, and some of them wore guilty of very cruel and oppressive ucts towards the
Xon-iotrasionists. Some of them, for a long time, re Non-iotrasionists. Some of them, for a long time, re
fused to grant any sites on their lands for churches fused to grant any sites on their hands for churches
other buildingn, thongh nearly all have now concede this favor. 1adeed, people at a distauce could scarecty conceive how high party feeliog ran, and what bitt remarkable is the degree to which it hus pussed nwity in so short a time. Iadeed, there are not wanting persons oo both sicies who think that s union may yet be effected; for the Free Charch has always kept te nacionsly to the pribciples of an Estahlished Church and this has been the oaly thiog that has prevented it union between them and other bodies who have seceded from the Fstablished Church, and who are opposed to the principle of state eadowments. There cau be little erably modifies the laws with regard to patromage. The prourresa of the Free Church since ist3 hat heen very re markable. It bas upwards of $8(\mathrm{k})$ ministerial charges, besides numerons preachios-stations; it supports missioouries in all parts of the worli; has established echools it almost every parish; bnilt charches, manses, school bonses, \&c.; anil has colleges or theological halls for the education of its mioisters io Ediaburgh, Glasgow, and Aberdea. The tenets sod governatit of the Free Church are ideutical, except is the points already indi-
cated, with those of the Church of Scotland.

specimeas of Gothic architecture sn Germany. lop 24,599.

## G.

## GABI

GThe seventh letter, and the fifth consonant of the English alphabet, is the third letter in those of all
the Oriental languages, and also of the Greek - the Oriental languages, and also of the Greek. The for"u of our $G$ is lorrowed from the Roman alphabet, io
whinta, as in all the modern European languasen, it stood Heventh io order of priority. G in Eaglish his two soneds - guttural and netiloat; ; before $a, o$, , and $u$, and
occasionally befors $i$ and $r$, it is the medial letter of the gutturial order, as io gave, gme, gusto, nod (in na excepional sense) io gitd, grt. The other sound, which it posesses only before $e$ uod $i$, is une of the medials of the sibilant series, having the satne sound, io fact, as $j$, as in gen, gin. G in its proper power, belongs to the order of gutturais $k$ or $\mathrm{c}, g, \mathrm{ch}, g$ g; of the two "bare" guttarals, $g$ is the flut (or medial), and $k$ the sharp; while ch and $g h$ are the correspondiog aspirates, - © as a Roman nbbreviation is nsed for gratis, gens, gaudium, de.
Q.V. signities genio urbis, G.L. genio loci, and G.P.R. gloria pupuli Romani. - At a sumeral it deooted 400 , and with is dish over it, thns (G), 40,000 . On the
French coins, $G$ indivates the city of Poitiers, and io French coins, $G$ indicates the city of Poitiers, and in chronology at is the seventh Dominical letter.
(M.ss.) $G$ is the fifth sound of the nataral diatonic ecale of $\mathrm{C}_{\text {, and }}$ the eighth satund of the chronatic scble. It stands in proportion to C as 2 to 3 ; is a perfect fifth above C , and the second harnooic arising from C as a bud imentil nuts. ans the noto $G$ w.ss called Sol, $R$ e, or Vt, according as the hextchord begun with $\mathbf{C ,}, \boldsymbol{F}$, or $G$. G major as a key his two flats at its signaturs, viz., $B$ flut and $E$ flut.

Th
lorva is yellowish, withent feet, short, thick, soft, com larya is yellowish, witheut foet, short, thick, soft, com-
posed of rings which luave a domble row of short teetl enrrounlling them; it is somewhat acuminnted nt one end - the head; and the rumath is furaished with twu cont of the horse's stemach, te which the But attacher itself, and from which it derives its subsistence, hangin in clusters sometimes of three or four, sometimes of more than one hnodred. In-re it spends the winter and in the following summer it disengages itself, atud heing carried throngh the lurse'e intestines, burrows i: the gromid, and chauges inte an oval blaca papa with epiny rings, from whicb, in a few weeks, the perfect Hypoderma Boris.) also called Bull-bee or Burrel-fly, is more tronblesome than any species of llorseloot. It is a beantiful ibsect, not quite half ao inch long, anl unspotted wings ; the face is whitish, the cruwn of the head brown, the therax black, the alulomen whitish with a broad black baud aronnd the middle, and yellow hairs at the extremity, where also the female fias an ovipositor,- a remarkable orgnn. forosed of a hurny sub-one another, inke the pieces of a lelescole, and the last of them terminatiog in five points, three of which are longer than the others, and hooked. By means of this organ a small round lole is pierced in the hide of an ox's back, in which an egg is dejosited. The fly is very quick in depesiting her egg, not remaining upon the wack of the animal more thut a few seconds, Cattlc the Gad-fly, and rush widely about, with head strctche forwart, and tail stuck out, to escapa from their tormentor. The further injury done by this insect is mit, however, usually great; the larva, a little pearj-white magget (warble or wormal), feeding upon the juices beneath the skin, canses is swelling, called a weurble,
forming a sort of sac, within which it lives and grows, amid a kind of pirnient matter stuted to ifs appetite, and from which it finally emerges, leaving a smath sure and like the liorse-bot, indergoes its further transformations in the gronod. By pressure on the warbles, Bots
may le destroyed; and when they are nnmerous, assiduous oiliog of the back of the ox is resurted to for the same purpose. - The sheep-hot (Crphalemyitu, or Cstrus Oris) is a mnch more serimen pest than any other species and is oot unfrequently very destructive to fiocks. The iasect is smaller than either the Ox-bot or Horse-bot

 (inel. (galct) $n$. sing. \& $p l, ~ A$ Scottish Celt or High Gaclie (ur Ease) Language and Literainme. (gmillik) The language prokern ly the 11 indablers frequently Ersh, evidently n corruption of Irivh. It is a dialpet of that areat branch of the Celtic langatiges termeal the Gwyddelian or Gaclic, and to which belong also the Irish nnd Manx, or that spoken in the Isle of Man. According to Dr. Prichard, the Celts are of eastern
origin, belonsing to the great Inlo-Enropuan fimily. origin, belonsing to the great Inlo-Enropean fimily,
They arrived before the Tentons from the regions on thi Oxus, and from Media, and penetrated throngh the Allophylic races aloug the sonthern shores of the Baltic sea at a time of which we have no historic data, At the time of the Ronzan invision, Ceftic was the spoken in W. Enrope. The dialects of the Celtic still spoken, liesides the three alrealy mentioned
are the $W$ cish, and the lamanage of Brittany; white the Cornish, anath diacet, thoneh nut preservel in troks. The three dinlects, the Irish, the Scottish-Gaelic, and the Manx, approach each other so
nearly ns to form, in fact, but one linguage, the penlinearly as to form, in fact, bint one language, the peeni-
arities which distinguish them from each other not being sufficiently broad or vital to constitute either of them : langmage of the Scottish Ilighlinders and the Irish exist partly in the promunciation, jartly in the gratmmar, and partly in the jdions. In the vocalunlary, also, there are considerable differences, as where words now ohsolete in Irish are still used in tho Scottinh-hinalic and others are used io a diferent sinse. shelion in different parts of the Highlands: and a native of Sutherland lias some difficnlty in understanuling one of the S
districts of Arayle. The Gaelic, which, from $n$ varicty of districts of Areyle. The Gaelic, which, from $n$ variety of
canses, has retatined, in $n$ consilerable degree, its original purity, is copions, bold, noll expressive. It derives lame, from which it differs in its structure nnd formation. liaving affixa and prefixes, it gratly resmbles and werew, particularly in the inflections of its nown different parts varcies. and the difference is yery marked hetween that spoken in the N . and S , pirts of the were, at an cirly period. inhabited ly the same race or raccs, aul an intinnate connection sulisist-d between the two countrips. Fir nearly fonr centries, from abont
the midhle of the $12 t h$ to nearly the middle of the lath cont.. accordins to mer. and islands and Ireland, but the fiternery inflaence was equally close ant strong; the Trish somnachies and turns were heads of a schor, which inchuled the $\mathbf{W}$. Nichlands, and the IIighland sennarlites were either of Iri-h descent, or, If of native origin, rowortmil to barilic schools complishments of their art." $A$ powerfnl inflnenc must thas lave lieen exercised npon the language und
literature of the llichlanis, which must have become literature of the llighlanis, which must have become
by degrees more aod more assimilated to that of Ire-
land. The written and cultivated bangnage of the Thaghtinnis thus came to bee flomitical with that of lre.
 nember Gache which promerved matyy of the indepen dent teatures of a mative langunge, and pxisted anomg the people ne a ppoken dinlect. The intronaction, howevcr.
 nemarer to the spakean diakect of the country arde compunied thy the premchitg of the clerey in the ac nucular dialect, tomided to perserve amblereotype the langume spoken in the highlande in fier netive fotm and fidem. The first prigted tomk in Gitelie was a trane lation of the forme of pruyer lesned liy duln Knox , nm printed it Edinimagh, 1:67. The second whes 11 trank-

 Gaclic of the metrical Penlma amil of the Scriptarem. In 1840 the firet Bible was pmblehed for the noe of the IVighlames. All these workn wire it the Prish oftherg ruphy and Irish diatect, the lant leeing simply an redi cubmhary. The first work publisheyl in Scottishitiatic whe baxters Call to the CNCionertorl. transluted by
 first translation of the Now Tustament wan publinhed in the secettish dialect : and in 3T-3, a trambation of the Ohl Testament wis undertaken ly thesemty for Pro pacating Christian knowledge in Scothand, not com pleted in 1ors inder schmars of Scolum to the Scriptures, the whole leing publinhed in 1826. The enrlicst Epecimens of \&cotish-thaelic portry are pre made in tho Dean of Lismore, and now preserved in the Advocnte" hilitary in Elinhurgh. A sejecton from it has rocently (1863) bern published, with translationse, by the Rev Thumas M Lanchlan, and an introduction hy Mr. W. F Skene. Sume of the pen-ms are in pre Irish, others in phre scottish-oaclic, and ethers in a mixed diatcot, in Which the one or tho other jum predommates. Tho light upon the much cuntroverterl subject of O- imis partus. "It contains no fewer than twenty-tight ()wed anic poems, externding to upwaris of 2, , 600 lines: nite Filidh, and one to Caolte MrlRoman, the three haribo of the Fente; two to Allan M-Rnadrige nud one to Gillie. Cal hmm Mac an Olla. bricus hitherto maknown: and elowen poems, Osianic in their style mut sulyect, to which no nuthor's name is attached." It is thus clear, "that the characters intronacel into Aacjheronn's poents were not invented. but were rally the enligects of trabition in the Dighlands, and that poems ecrtainly exi-te4 Whans anint pherson hal nsed many kuch poems in lis work, but by joining separate pitece ther and antitug loneer poems, and into the so-cnlled epics." The Deanie collection nffurd a fair specimen of the pobtic literature in the lighlands of Scotland beforo the fall of the Lords of the inles, and the introdnction of the principles of the Reformation. - Ref. The Highlaniers of Scot-
land; thrir Ifstory, Origin, ond Antiquities. liy W. F

Gala'tianv, (Sr. PAul's Epishle to tez.) (Script.) One of the cabodical epistles of the New Tebtament, writ It is sald at the end to lave been writteo from Rome but this is generally beliesed to loe jocurrect. The anthenticity of the epistle itself has never been called in question, and is frequently cited by the apostolic atui other early fathers. Two juurncys of the apostle to
G.d.tia sre mentivied in the Acts of the Apostles, and Ghatis sre mentiould in the Acts of the Apostles, aud was written. Shortly after his departure, Judaizing teachers sppear to have come amon: them, preaching "another gospel" than that of Christ, and to whom they were giving heed. Thuse teachers also endeavored to subvert the apostles anthority, by sttacking his character, and asserting that he was eot divioely appointed. Paul, therefore, in his epistles proceeds to controvert
these errora. He vindicates his chanactor, and asserts bis these errors. Le vindicates bis character, and asserts bis
divine appoint ment and the trath of what he had tanoght divine appointment and the truths of what he had thoght
them, declaring that, "though we, or an aogel from heaven, preack any sther gospel nuto you than that which then pruceeds to poiat out the relationship of Judaism to Christianity, thit they are now no lonzer noder the law but under faith. beyns male the chilliren of God throngh faith in lesus Christ; and exhorts them to "stand fast, therefore, in the liberty wherowith Christ hath made ns free," and not to be" entanglellagain with the yoke of bondage." He alsu exhorts them oot to
fulfil the lust of the flesh; lut to be led of the spirit, fulfil the lust of the flesh; lut to be led of the spirit.

Cial van'ic Bad'tery, $n$, (Piyg.) The combination of a number of quantity of voltaic or dyamic electricity. Th. first electro-mutive apparitus or battery whe constructed by Volta in 1800, and consisted of a Ecries of discs of silver or copper, zinc nud flamnel, or pasteboard eoaked in salt water or dilute acid. These discs were alterbuilt up. (A B, Fig. 1110.) To the murtanlic ends of this pile, wires, $w w$, were connected. With a fhock was feit on joining the wires, or the gold leaves of mo electrometer conld be dierged. Dry piles are constructed that will remain uctive for yeare. One of the best of these consists of discs of paper rnbbed over on one side with peroxide of manganese, and coated on the other with thin tin or silver leaf, genersilly sold attached to the paper. The hest of these piles are
bat feeble, and the inconvenience of naing them, soon led Yolta to the improved modification represented in Fig. 1111. The
 Fig. 1110. in its place a cup of dilnte acid is sulstitut of these cups is a plate of rinc, aud one of silveror cuper so connected that each silver and zine plate is in we

Mrrangentent. Bunzer's battery is a modifratation of Oruve's, in which the plis timum is replaced ly a cslimer of the bard coke olitained from gas-retorts. The relative value of different batteries has theen estibuated itn varions ways. The following thble shows the amount of copper deposited from a solution of the sulphate in one hour by each of the batteries men-
 same surface of zinc, wats used.

Continuing the operntion, it wes foond that in respect to comstancy, Daniell's lad the advautage, see Gisl
Galivanismo. n. [From Gafvani.] That branch of the science of electricity which trats of the electricuty de veloped by chemical action. In 1589, Gnlvani, a profesent of anatomy at Bologna, made the discovery that tha imbut a frog is convalsed when the nerver and nuscles are tonched with two different metals and the metale brought in contact. Spon this and similar phenomena,
Galvani based his theory of "animal electricity," nccordGalvani based his theory of "animal electricity," accord ing to which every nuimal is etudowed with an inherent electricity, generated in the brain, and distributed ing the mascles. Volta is professor of nitural philose ply ing the muscles. Wita, profsssor of natural phitoerply contractions depended not on buy electrical condition of the animal frame, but on a feetionction derived from the metals with which the nerves sand muscles were brought in contact. 11 is researches led to the divcovery of the pile, mn upparatus which mast be regurded as the source of all the great discoveries in this department of ecience in monlern times. It, with its important modificatione, is folly described under the liead of Galvanic Betteav. The contact theory of Volta nseumes that different metale havo different electrical capacitice, and The chemicol theory, now generally adopted asstames that the chemical action between the solids and liquids of the buttery is the soarce of its power. Nany facts of the battery is the soarce of its power. Nany facts
support this theory that are inexplicable when viewed by lle light of the contact theory. Faraday rud othere bave proved that chemical action doee give rise to elec trical force; that, when the chemical action of a latiory diminishes or ceases, the current diminishes or ceases and that powerful currente may be generated withmi bringing dissimilar metals into contact. There nre, in deed, many reasons fur sopposiug that chemical aflinity and electricity are only moditications of the sumb force. tically applied to many tuscful purposery. It is empulayn in telegraplay (see Trison aph) and its power ef convert ing iron hars into ternporary magnets of ereat power is used in the construction of electro-nutive engines and

Game, $n$. [A.S. gomen, joy, pleasure; -allied to Gr
homes, it revel, a nerry-making.] The term applied t. homos, in revel, a nerry-making. $]$ The term applied th as a relaxation from business or otody, or employed as
mode of pasing the time. They are divaded naturally mode of passing the time. They are divaded naturali they ure distinguished as gomes of chance, games of skill depent upan the atteation and dexterity of the player but merely determined by chavce; it inclutes gimers g.ones played with cards, such as quinze, ringl-t-un, lans tuent, connerce, lon, \&c. The second class consprehend
those games which, when once hegon, are independent of chance, and are gained by the superior shill and ex pericace of une party. In many games of this kiod, however, when the skill of the parties is equal, he who plays first is most frequently the winaor. There are very few mental gimes of thas class; but chess and droughts hold the highost places. It includes several interisting and p"pulur physieal games; among ethers, crickel, base-balh,
bowling, ${ }^{\prime}$, , tennis, billicurds, \&c. In the third clave the gatues are generally decided by chauce where the players are equal, but otherwise depend much for their event on the skill and cantion of the players: among the must important of these are whist, cribboge, piyuel, -Jest, as oppused to seriousness.
-Insolent merriment ; spurtive insalt.

- An exercise or play for anusemeot or for winning at jhay; ua, to win the game, i.e., the stake.
-Scheme pursued; measures planoed.
-Field-sports; the chase; falconry, \&c
Some nportumen, that were abrond upon game."-L'Entrange. of the field.
"At hanan hearts wo fiog, nor ever paiss the game."-Prior. Public Games of Anlinuity. (Hist.) Uuder this name are gunerally included the contests and spectacles of
yaricd kinds celebrated by the ancients, which, in the arlow iges, were cumected with religious cer-monials The public ganaes of the Greeks were very namerous, and the origin of many of them is lost, on account of the religions nystery in which they were fonnded. Among pic, the Pythion, the Nimean, and the Isthmiun. The conquerory in the Olympic gamen were beld in bigh reof men. Thene ganes wire held every 5 years at Olympia, io Elis, on the W. side of the Peloponnesus. Anvong othorsagility. Tho lighter excreiges comprinol running. Imaping, thowing the groit, and burling the jovelin The more severe conrne of disciphine includes wrestlings and boxing. Racing ubo constitutiod a particular tent. ure in all the ameient gamey. The lsthmian games were
hold at Corinth, mat, together with uthletic exorcises, herd at Corinth, and, together with nthletic exurcises,
horse and chariot racis, constituted a harge portion of the apectacle. Originally these ganas were conaceded with apectacle. Originaly these games werc comaected wind
the worship of Noptune, the wide diffuntun of which gained for them the great celcbrity which they lons enjoyed. The I'ersiata war gave na itopulse to the Isthmian ganee, whila the Peloponacsitus war dimmed thid fapprtance, but werosexhitited with increased celchaity They were then thell overy tharce years, and comprised threo lowling livisuma,-mavicul, gynnustic, unt equrttrith contents. The prize at the blympic gumes whs

Ganırewe, (gang'grēn,) n. [Fr. gangréne; Lat. gangrena: (ir. ganguraina, from groū, grainö, to prouw
Sunsk. gras, to devour away the tissues. (Mred) A term applied to the first stage of mortification. It is divided into two kinds, the moist and the dry; the former, called also inflammatory ur tuente $G$., is that
which is preceded by inflamation; while the latter, called also chrunic or idiopathic G., is that which tuked place without risible inflammation having prucedet it
The most frequent causes of $G$, are violent inflamastion, erysipelas, contusim, buros, cold, and teficient circulation of he blood or aervous energy. Whell it results severe pain in the part attacked, aoll renerally considerGevere paia in the part attacked, a0n generally consider-
able swelling. After a time, the part loses all sensibiluble swelling. After a time, the part loses all sensibil-
ity and becomes coll, the redness disappearing, and the skin beconing of an irregular dark color, in some portions approaching a black, and in others a dark-browt or greenish late. If there is a rupning sore, the discharge will cense; and a bloudy sernm forms under the skin. The inflrmmatory fever distoppears, and is succeeded tuy great langnor and debility: the pulse is work, quick, and irrecular; the stomach is deranged, deliriom frequently occurs, and hicrough is one of the must cbarncteristic sighs of the disease in its more advanced
stage. The fratur"s are collapsed and the eyes sunk. Whane. the $G$. is not the rosult of hight and active inflammation, the febrilesymptomsareslight or altogether wanting; but there is the same discoloration of the skin. discharge of bloody serum, an moruific appesiance. $G$.
resulting from severe cold is remarkable tor the little pain generally preceding, the part haviag frequently perished withont the patient being aware of the fact. A part suffering froto severe coll slould first be rulhted with snow or a course towel, in order to restore the sus-
pended circulation, avoiding at first any artificial heat, pended circulation, avoiding at first any artificial beat,
which might be the oncas of inducing inflammation. G. may arise frum a discaspd state of the blood-vessels, mttended with debility of the conatitution. This foro of the disease is comtuonly known as gongrena smitis caves occar in earlier life. It is best cx-mplified when grail, homs, and redaess being the first symptoms, after which the parts becone gradually blank and dry. The hands, fore-arms, tud feet are chiefly affected. It is thit dry form of $G$, which is produced by the ingustion of orgot of rye. (See Ergooris.) Inspital G, or phagedana graprennsa, is is form of this disease which atticks open
wonnds or ulcers, fud is so called from its appearing wonads or ulcers, and is so called from its appearing
most frequently in crowd hospitals, and catusing a most frequently in crowd-d hoepitals, and causing (Pint.) A disease in plats ending

Many species are fir of their beantiful and fragraat flowers. The curotla is fnunel-shaped, the tulue punch larger thau the calyx The fruit is a berry crowned with the calyx. The gema was named after br. Garden, of Charies
Gar'deatags, ". The act of laying out and cultivating pieces of gromnd, generally of limited extent, and inclosed for the purpose of rearing vegetables, frmits, nod flowers As au art of design or taste, gardening is of very ancied
date, and with the exception of certain nodern inpros date, and with the exception of certain ohodera improve
ments, such as glass-houses, \&c., was in a high state of ments, such as glass-houses, \&c., was in a high state of
perfection two thunsand years ago. The carliest gardens perfection two thousand years ago. The earliest gardens
of which there is eny account ars those of Sulowun, which are described as haviog been of quadrangnhar form, surronuded by high walls. They contained aviaries welher Persian monarchs were of grat extent, end gen erally laid out in romantic situations. They were alsu distiuguisbed for the great diversity of their uses and products. The first allusion to terraces in gardens is to
be found in the description of the celcbrated hanniog gardens of Babylon. Although herudotns and other do oot meation it io their descriptions, there is hittle donbt that these terraces were decorated with vasee parapets, \&c. Most of the elements of a modera architectural garden are alluded to in conaection with thos
of Babyloa. The terraces are described as being furof babluloa. with groves, containing fountains, seats parterres and banquetiny-rwoms, and as combniag the miunt and banquermp-roms, and as combninigg the minnt shiade and extensive prospects. The grove of Urontex descrifed by stratio, must be regarded wa a jark or large garden in the picturesque style: it was nine miles in circnmference. In ancient Greece, gardening was rathe a aeglected art at first, int is process of time great ad
vance was oude. The vale of Tempe tho Acadenns at vance was oande. The vale of Tempe, the Academins at Atheas, and other public gardens, were extremely ele-
gant, and were ornamented with temples, altare, tumbs, gant, and were oruamented with temples, altare, tumbs statuex, monuments, and towers. Onacconnt of the nacure of the climate, the chate quidities reguiled in and repuse. The Greeks copted their gardening fron
the Persians; nud the Romatos, in their turn, copied that of the Orceks. Little is kuown of the curly style of Foman gardening: the vast edihces projecting into the sea, nod the imucuse artiticial elevations, areapparently ridicnled ly Cicero and Varro. Abont this time, how ever, the cultivation of odoriferons trues and plants began to be attended to; and the planting of trees adjoining each other, whose odors assimilated, wits then as much a study with the gardener as the harmonious
Ulending of colorsit the present day. The early Fremeh blewding of colors it the present day. The early Frobeth
and Dutch styles of kardening wero evidently adopted and Dutch styles of kardening wero evidently adopted
from tho docrijtion of Pliny's garden. On this sulject from the dewcriftion of Phny's garden. On this sulject
Londen remarks: "The terraces atjoinink the house the lawn declining from thence, the little flower-garden with the fomntaith in the centre, the walks bordered with box, thad the trees ehcared into whimsical urtificia
formas-toge ther with the fonntains, alcoves, and sum mer-houbes, firm a rpsemblance toostriking to bear dis putc." The nse of glass in the constmetion of conserand tho "Garilcys of Adonis," their thost emincol Adons, mentioned by some of It is eaid that in them were to wo seen raro trees from Indan and China, the myrtloand crocns in flower, and the cinmazonanif frankincense trees corcred with leaves Cuetmbers were also grown there all the year ronnd ployed at tho same time. Gnrlening, liko nll tho other proy lanenished durine the durk ages, lut with othe vival of learning, the invention of printing, and the Reformation, it began again to flomrish. The art was revired and pratronized by the fimily of tho Metici in Itals; mul their garalens, which wore of the geenuctric and architeecturil style, Jong servel as molele for most of Earoine. It contimucd to be imitated in France, Ber-
 or matoral ntyle. In garden architecture very pittic
progresg, as fir as hut-homses aro concerned, han lueel made In the sontls of Furope, the warmth of the ell minte rondering them all lut urelese. Thern are, haw
 other closely: Aymmetry ond profime ormanent are the other chasdy: mymmetry and profine ornament are the
characteristics of both. The Dutch style In eminently adapted to the nutare of the country, where there are no ingualition of nurface as in Fingland. The Fremeh style noeme to havo arinep about the midile of tho 15 ith
century, dnring the reigu of Lonis XIV. The moet cele brated gardecer of the period was Le Noutre, who laie out the famous girdens of Versailles, Le Nútre's stylo spread rapidty into other countrivs, and was extensively adopted in this conatry. The first erectiun of hot-honses in rrance occurred tuward the end of the reign of Lohia
IIV., by M. Fagoa, ia the Jardin des Plantes. The firet magnificent attempt at hot-honse buildieg wat that of Fruncis 1. of A ustria, in 1053. They were io five ranges, exteuding ritogether to then anany gardering, and the adoption of the Findith style, rap illy rpread into France, Gernany, and Russia, where it still prevails. The art of cultivating flowers and fruits in gardening will be fonod more jarticularly descritied under the art. Horticuiture. Sce alrulirarting, GreenHovise, Hot-muse, Hot-ded, Stove, de.

Gar'riek, Davin, the most celebrated actor that hasever French on the English stage, was descended from a the family, who, veing Protcetiants, fed to Lnyland Peter Garrick, was a captain in the urmy, nod gencrally resided at lichfield; lint bein on a recruiting party at Ilereford, $G$. was B, there in 1716. He received his edacation partly at the grammar-echool at Lichfield, and nartly under Dr. Johnson, with whom he first came to the law. The death of his father, howerer, disturbed

## Fig. 1123. - Garrict

this arrangement; and having lieen left \$5000 hy hia uncle, ho went futo partnerwhip with his hrother in the "ine-(rade. A love for the stage had long been deeply rowned on bring an artor. His first attempt was ot 1pswleh la 1it1, nuler the neanmed name of J.yddint; Had the applanse he met with inducel him to pouke hbs nppestance at the thentre Gumbman's Fiethin, in the character of Richaril 111 . The effeet of this way ins-
medlate and dectajive. The nther theatres were quickly medlate and derdsive. The nther thentres were quickly
tleserted, and Goodman's Field wecame the rewnt of 986
people of fabhion. till that theatre was shnt rep. G. then Tormed un engasement with Fleetwood, the lessee of Drary Lane Theatre. The remanoder of bis carcer was along and uninterropted series of succebbes untilits uson retirement, and sold his moiety of the concern for upou retirement, add sold wis morety of the concert for
$\$ 1 s 5,000$. The last part which he performed was "Don Felix," in The Wimder, for the besefit of the Theatrical Fund. At the conclusion of the play, he adilressed a which this was dclivered aod recejved rendered it traly which this was delivered aod recejved rendered it truly platulits so loud and unanimous. in 1769 lie prijected and carried into effect the famons Stratford Jubilee, a striking proof of his enthusiasm for Shakspeare. It occupied three days there, and its representation at the theatre lusted for 92 mights. This great actor D. Jan. $20 t h, 179$, his remains being interred with great pomp in Westminster Abbey. As an actor, G. seems never to have been equalled for truth, nature, variety, and facility of expression, though perbaps suryaksed by some of his contemporaries in the enunciation of calm, sentimental eloquence. He wrote, or adapted for the etage prologues and epilognes. The style of actingintroduced prolognes and epilognes. The style of acting introduced
by $G$. Was the very opposite of that formal declumation practised before his time; it was natmal, vigorous, and fimpassioned; the plays of Slakspeare grew into greater repnte; and a reform both in the conduct aud license of the drama, favorable to his taste and genias. was effected by his example. There is a fine portrait of $G_{\text {. }}$ painted ly Pine, in the Nitional lortrait Gallery, London. His correspondence was publisbed with a memuir in l831.
dar'rison. Willism lloyd, an American philanthropist, n. lec. 12, 1801, in Newburypurt, Mass. G. was early put to scrvice, as errand-boy and csbinet-minker's apprentice, bit first found his irue socation on entering be wrote anonymously for the paper on which be wulked and at 22 owned aod edited the "Free Press," and, npon that failing, edited in Boston the first paper ever devoted to total alistinence, and at Bemington, Vt., a semi-political, semi-reformatory paper. In 1:29 be wss persuaded by Benj. Lundy to joill lim in editing in Baitumore the "Genins of Universal Emaucipation." llere, for an artiple on the domestic slave-trade. he was plose cuted for libel, nai, upon conviction, inprimoned till a friend patd his fine. Removing to Boston. he founded the "Liberator," (weekly, in Jan e, 1833, and continued to edit pation but also other reforms, such as perce tenperpation, but also other reforms, such as pence, teniper-
ance, woman's auffrage, abrogation of capital punishment, and religions freedom. 1n Jan., 1ria; he mesisted in fonndibg the "New Engiand (aftorwards Massacliusetts) Anti-Slavery Suciety." and, in $18: 38$, the "American:" of which latter he was president almost from the first to his withdrawal from the society in 1865. From these eprung numerous other socicites, until the Alrolitionints became nin nppreciable and formiandle body. though acting wholly outside of politics. The ductrincs of the "Liberator" cansed great excitement at the Sonth, and, in Dec., 1831, the Geurgin legislature offerea In Oct. 18,5 , $G$, was mobbed at a pullic meeting io RusIn oct., ${ }^{\text {asis, }}$, was montlemen of property and standior, ton, by" gentlemen of property and standiog." Hartly
stripped, and with a rope atout his middle, be was with difficulty rescued by the unthorities, and lodged in jail for bafety. $G$. foresatw the idevitable fate of slavery in the civil war, rand celebrated its downfall on the ruins of Fort Sumter, and among the freed people of tharleston. In $1832,18+0,1846$ he visited Eagland an a rejiresentative Abolitionist, and again in 1abi for him health, which was much inpmired. On this last oceasion he was feted by the most eminent Englislimen, and pre sented with the freedom of the city of Iolinturgh. Ilis collected u ritings consist of Thoughts on Aflica $n$ relor

Fig. 1127.-manupactere of coal-Gas.
coal are briefly as follows :- Coal is heated in long flat (a, Dished cylumers of clay or iron called $\tau$ ctor (a a, his of the mranged in long brick forbaces. The mouths of the retorts are fitted with aovable lids, ren from the upher side of the of clay. An iron pipe, $b$, rises ered at the npper of the front of the retort, and is cos a mach wider tobe, c, called the hydraulic into the side of above the fornaces, at right angles to the retortsoing receiving the tubes from all of them. The laydralic main is always kept half full of the tur and water that condenses from the gas, and the delivering tnbes from the retorts dip below the surface of this liquid, so that althongh the gas can bublule freely throngh it as it issnes rom the retorts, none can return through the tnbeg while the retorts are open for a fresh charge. The aquenas partion of the liquid deposited in the hydraulic ing chicfly of a solntioniacal liquor, from its consistprincipally the sesquicarbonate ; snlphide, cyanide and sulpho-cyanide of ammoniemare anlpo foup cyanide, and the hydraulio main the gits passes into the condencer which is a scries of beat fron tubes kept coul either loy the large surface which they expose to the sir or some fimes by a stream of cold water. In these are deposited the remaining water and any of the volatilu hydro-carthens and salts of ammonta that escaped condensation in the hydranic main. As the ammoniacal salts ne not completely removed in the condenser, it is usnally necessary to pass the gas through a scrubber or cas contaniog fragments of coke, over which a stream of Fater is Allowed to trickle in order to athorlb the remainint ammoniachl vapors. The gas is now passed through and sulphuretted hydrogen. Tha lipu the carbonic aci box, in which the gas is made to palas over a mixture of slaked lime and sulphate of iron (green vitriol or op peras), mingled with siw-dust, to prevent their caking together; or sometimes it is a vessel in whichar mixture of hydrate of time nod water is kept in a state of agitation while the gas is passing through it. The next operation, which is often omitted, is tn pass the gas throngh dilnte sulpluric acid, to remove the last portions of ammonia. The purified gas now passess into the gas-hotder, (g.) from which it is supplied for consumption. closed at the top and gas-holders is that of a cylinder closen and in a reserroir of witer suspended with its surface, a cylinder has of water: since, with a given surnace, a cylinder has the great-st cmpucity when its generally so construcfed They aro the cas-holders are plates, riveted, and coateal with tar on hoth sides to make them kas-tight. They aresuspendeml in the water hy means of chains, and counterbalanced und guided by Weights and wheels, so at to rise noll fatl with ease l'wo tubes pass under and through the water, reachin above its surface into the bollow of the gas-lwolder. One

is forced out through the pipe $k$ to the down, and the gae the gas is discharged, the bolder fills with water, As ready to receive a fresh supply of gas. Most cas-work bave a mumber of holders - some filling while other are emptying; aud most holders are furcished with som contrivance for indicatiog the exact quantity of pas which they contain. The telescope gas-holder (Fig. 1128 ) with the same diameter, holds a larger volume of gas than the one above described, sad consequently requires ess space of gromnd. It consists of two, three, or more oncentric cyliders, the bottoms and tops of which except the upper one, are firnished with flanges turned iag outward and npw, - the flanges at the bottom turn in ward and downward. Wher the one at the top turoing the innermost cylinder rises firat the gas is introduced reaches nearly to the surface of the water, its curved flange catches the flange of the next cylinder curved also risus,-and this in turn lifts the next, and so on The escape of gas ind the admission of nir are prevented by the lower fange taking upa quantity of water, which acts as a water-lute. The temperature at which the gas is produced should be regulated with great cure. If too ished in quantity and impaired in and the gas is diminthe retorts are quickly burned, out, and the olefiant gash, the most valumber The use of the gases proiuced liy gas, is decomposed. tillation of coal for the purpuses of ill destructive dismodern invention; but to long ang as Jtiss if is of Clayton, dewa of Kildare, described the as rethod of filing bludders with what he called the spirit of coot, of flaing lyy distilling eoal in a retort ppon in coel, obtained sitys: "1 have frequently taken one of these bladders aud pricked a hole therein with a piu, and compressing gentiy the hladder near the flame of a candlu, till it once took fire, it would then continue flaming until all was the more srrprising out of the bladder; which way difference between because no one cunld discera were filled with common sir." Hadders sud those that doch, of Redruth, in Cornwail, In 1792, Mr. W m. Minrapparatus, sad in 1798 a larger and improred gas or lighting Bonlton and Watt's harge improved one, near Birmingham, which, on the ocrision of the peace of Amiens in 1802, was publicly illuminated l.y this mesns. In 1803-4 the Lyceubi Thentre in London whs lighted hy gas, snd in 1n13-14 Westaninster Brilge and part of the strects of London were illuminated be the same means. From that time itc nse steadily in ceased, until now it has lecome genernl in the tiwn and cities of the civilized world. In the United Stutee attempts were made to introdnce gas shout the yen lurk in $1 \times 2 \mathrm{~F}$, and in Philadelphinton in 1822 , in New best foreign cinnel-conl are solphia in 1sis. From the as 15.000 cubic feet of gars per ton; but from the high in ordinary use, 9,600 to 10,000 feed per ton is an asenul yield. The price of gas saries of cuurse with the cont uf coat and latur, It ranges from \& 2.00 to $\$ 4.00$ per 1 , ono culic feet ia the principal cities. In pome of the smaller towns, where the consumption is less, the price is considerably higher. The illuminating power of gas io ascertained ly comparing the flame of a borner cenofming a given number of cubic feet per howr with that per hour. A burner consuming 5 feat of biver of goains has an illuminating power equal to that of from hour 20 condles, cach burnugg 120 grnins per hour Grom 15 to be used on railroad-cary und steamber hour. Gas may ing it in strong eyliniers. The flow from these is regn hated by an arrangement that enlarges the greggfor its escape as the prosenre diminishes, thas is quite extensively used for heating purposes, und varions hurners unil atoves are contrived for this purpose. Tho recent improvements in the mannfictore of gas by what is known as the Love procose, alter the ibventor, T. S. Lowe of I'n., by the introdartin ernde futminm and the decomposition of stean, will materially der Trase cents per J, oun feet. (Soe it is ctaimeti, to me low ux 50 iaw'-miniat,

Gasseat'li, Pierre, a French philosopher and mathe matici.1a, B. in 1592, at Chatersier, near Digne; io the
words of Tencemann, the nost learned losophers, and the ablest philosopher among the learned, of tha seveuteeath century. In speculative thinkiag G. represeuted the Sensetimat School, of which ho may be considered the founder in modera times; as such, he may staml agninst the Writitations of Descartes. In the cal question of Sensationalism, almose in the firm in which it still presents itself, was fairly raised; it must be conceded that the temper and modernation lay with tice, the weight of argomeat belonged to his illnstrious opponent. Dariag the disputation, Gassendi had the opponent. Duriag the dispntation, Gassendi had the
merit of insistiog that every neatal conception of Prin ciple is necessarily preceded by the fuct of an Experihis philosophy, but remarkable as bawing first givenexpression to a maxim now held alike by Sensationalist and 1dealists, - that in seosation is the begioning or
the occasion of all knowledgo: a maxion of which De the occasion of all knowledge: a maxim of which Des cartes himself, perhaps, saw enongh to render nojnstıi-
able Locke's subsequent singular misrepreseatation of able Locke's subsequent singular masrepreseotation of
the doctrine of ionate ideas. This proposition granted however, it in no wise follows, as G. contended, that t edge: or that an Absolute and Necessary Truth is a mere generalization. Ratiooal Psyehology, acrording to Dee generalization. Ratiooal Psychology, acrording to Dest and aecessity cannot attach to simple generalizations and these attributes belong to many of our idens. It is hardly requisite to say that the dispute thus raisell exists still; nay, the stedent desirous to master it will scarcely find better in-troctors tbin Descartes and $G$. period when many great minds pushed forward the wor period when many great minds pushed for ward the

kitchen. At length the aurora of the magian ages began to dawn. Mas had hitherto known only hager: he er on gnstercome acquaiatod wita satisty sidon learns how to ent $t_{i}$ aod it is Cadmus, gramdfather of Bacchus, the finture foander of Thebes, who takes upon himselt to instract his own angust palate. In the time of Alcibiades the best cooks came from Sicily; Trimalalcio was one of the most celebrated. Athensus tells us that, when he conld mot procos are and hite their form and flaver with compon firh that even the most cunning pienres were invariably deceived: - which remiads uy of the cook of Louis XIV., who, on a Good Friday erved the king with a duner, appareutly composed of poultry mul butcher's motat, but which, in reality, conisted of vegetathes only, and nrepareh, tod, au maigre. The Romans, inheriturs of the lixney of AsianalGreece, did not erect a temple to the greedy Allephagia, goddess of good cheer, who possessed altars in Sicily (.Elian.
Vur. Hist, i, 2i): but they thousht it inpossible to reVur. Hist. i. 2T); but they thought it inpossible to relimits of the pleasures of the table. Autooy gave a supper to Cleopatra, and that princess praisiag the excehence of the repast, ber lover immediately called for low far the presented bim with at city ia rucompense. fow behiod the most molest collations of tireece and Rome! Lucallus eatased to be served to Cicero and Punpey a little amligu, which cost $\mathrm{S}_{5}, 000$, There were only three of them to partake of it ! The Emperor Clandine lisul generally 600 gnests at his table (Surtm. in Claud. 32). Vitellins aid not spead less than \$16,000. upoo each of his repsats, and the compusition of his favorite dithes requirel that vessels sbould regnlarly ply betwen the Gaif of verico and the strats of Cadiz, in the pursuit of delicacies (Surton. Dion). G.alba breakenriched a handred families. Elius Verus inventod the pentopharmacan, a kind of macédoine, composal of sows' flanks, pheasants, peacocks, lism, and wild boars' flesh (Spartian. In Vero, 5). Geta insistel uper having as many conrses as there were letters in the alphatet, and each of these courses must contain all the viamls whose name began by the same letter. These when Ronee erambled beneath the iovincible weight of that horde of barlarians which Disine vengeance reerved for the puaishment of whieard-of crimes. But the culioary art always survices revolutions and ruins of empires. Modern Italy inherited the wreeks of Ruman cookery, nod, thanks to her, Europe is at the presthe charm of joyous and digeatilio repasts. In the Mill dle Ages, ponltry, butchers ${ }^{2}$ meat, and roast game, were never eaten dry, ns they are now, any more than frime fish. There wore different sances for all those dishes, und even for the different parts of each aninual. The cooks of those days strove to acquire a reputation by inventing strange and grotesque baces, which had no other merit than that of being surprising and difhealt to make, as, for example, eggs cooved on the spit; butm friel or moasted, \&c. We recagnize in sume of our inost common ragonts those of which our ancestors were so fonll in the Middie Ages, bnch as the bauf a las baxuf, veau percé de gros lard, fricassér. de poulet, blanquille de vraus roti; but wo hise lust the pot pmurri cumposed of beef, veal, mattum, bacon, and vegetables anil the gatimafrée (gallimitity), a kind of fricuss of fowt, suranel with ware, verjuice, and spices, and
thickuned with the fitmons sauce Claneline. The coukn frepuently placed on their masters tables rogouts and other dishes horrowerl frum other oations; as, for example, a derman butert, a Fleminl chuudeua, eggs a la Flo-
rentine, and partrilges a la Catolane. They knew the

Gender, n. [Fr. genre; Lat. genus, generis, from gionore, to prodnce.] Sex, male or fomale Nuubs deneting the mate sex are sasid according to sex, thuse donotiog the female sex, feminine susculine; which denote neither male nor female are said to be beuter (Lat. weutrius gmeris, of wither gender): and hence grammarians have come, somewhat incorrectly to speak of three genders. There can, properly gpeak nige; as the two genders, the masculine sud the fenithis doctrine is buits. There is the basis upon whit ever, of which it is difficult, or useless, to determine the ex: and there are also may things which cannot the distinguished at all. These are geaerally regarded as belonging to what is teraned the neuter gender. There are, however, certain ideas, as bagnitude, strength, vigor, \&c., which are considered as characteristics of males, while geatleness, timidity, submission, \&c., are regarded as properties of females, which, when they come to be associated with a nevter nono. raise it to the masculnue or feminine ; thus we speak of the sun as he and of the moon as she. Abstract nouns sad genera hoe and femining are sometumes depoted the mamcuwords, As boy, girl horse mare, cocl. licn ; beusetimernt a change io the termination, as count, countesn, executrix, zongster, somgstress; and sometines by the addition of a word, as cock-sparrow, hen-spurruw, hegoat, shr-goat.
iender, $e . a$. To beget ; to engender. - To produce to canse; ue, to gender strife.
demeagen'esis, $t h$. See PARTHENO-GENESIS,
Genealos'ieal, a. [Fr. généalogique; Gr.genea, a race, and logos, a distonrse.] Pertaining to, or exhibiting the descent of persons or families from an ancestor. - Ac-
cording to the descent of a person or family from an
Genealog'ieally, adv. By genealogy.
Gieneal'onist, $n$. He who tracee descents of persons or fanilies.
Aeneal'osize, v, $a$. To relate the account of descents.
 ulogia, trom genea, a race, and logos, a disconrse.] An account or eaumeration of the ancestors or relation of a particular persuo or family. No mation was nore careful to trace and preserve ite genealogies than the
children of lsrael. Their sacred writings contain gechildren of lsrael. Their sacred writings contain ge3,500 years, from the creation of Adam to the captiv ity of Judah, and evea after that time. Jostphus in of Levi liy means of public revisters, and that howerer dispersed and depressed his nation were, they never nege dispersed and depressed his nation were, they never neg muthentic documents which were kopt at Jerusnlem Since, however, their destruction as a mation by the Rumana, all their tables of descent seens to have been lost; nad even the Leviter, who are still distinguished from the rest of the people by the exercise of specinl, boborary, religiona functions, are known as such only
by being acknowledged as descendanta of pareuts who by being beknowledged as descendanta of parents who
exercised the same. The inequalitics of rank and right exercised the same. The inequalities of rank sud righ cal inquiries lighly cal inquiries highly important, and it was then that which became closely connected with heraldry, ( $q, n$ ) Which became closely connected with heratdry, (q. r.) in such casee, the chief object being to trace the origin of familics into the remotest nutiquity. Attempite to carry this to an absurd leagth are frequently manifested in the earlier genealogical works. Critical kenealonsical studies were not hegun before the lith century. Geno alogical atcounts are not only interesing to pervong
who feel a anore or less natural curiosity abont their who feel a onore or less natural cariusity ahont their nacestors, but are also useful to the listorinan. as elucidating the often complicated relutions of dymasties, fanilite, claims, and controversies of fuccessions, \&c. They are also of importance in legat cases cuncernimg claims of which theomioyment of eertain rights is male to depend upon lineage or descent. A gencalogy, or linenge, is frequently represented in the form of a tree (arbor consanguinitulis), giving a tistinct view of the varions bramches of the fumily, and the degrees of tescent from tha common progenitur, who is penerally represented

ticulars; the total; that which comprehends ant, or the chief part.
"In particulars our knowledgo begins, and so sprenda itself by
egroea wo gentrals." - Lock.
(Eccl.) In the Reman Catholic Church, the supreend head, nulsr the Pope, of the ragregated communitie thrimphout Christendom belon
ne, the yeneral of the Jestits.
nu, the yencral of the Jestuits.
(Mil.) lo our army, the name of the bighest military rank that caa be conferred on tificers. Gerueral oflicer are of four crades - genera, lienteuant-g6ucral, Enajor orisinated in Framce alount 1450, when John, Count do Dunois, was made-lienteoant-general of the French forcee or commander-it-chict, representing the severcign, whe had delegated to his lientennit-generat the performane of the daties that wond etherwise have devolved upou
himaselfas actual commander-in-chicf of the nrmies. The himself as actual commander-in-chief uf the mrmies. The
title came into nse in England in the reign of Ilenry WII, when the mpellation of captan-graral was givei of thint of lord-marshal of England. From that jeriod the title of generad, both alone and distingoishell by various irefixes, has been preserved in the
[Fr. ginérale] (Mit.) A beat of the druen serving as gral to an entire army.
In general. For the must part : generally.
Tieneralis'simo. $n$. [It. ; Er. géneralissime.] The
dhiuf connomder of an army or pillitary force; wher chief commander of an army or onilitary force ; upe
cially, the conmander of nm army uf two or more grand divisions, each under command of a sepmrate general.

General lssne, $\boldsymbol{a}$. (Lavo) A plea which thwarts or denies at once the whole declnration of the plantiin. without offering any fepecial matter whereby to evad it : as is action for wroug. "wot gnilty," or for thelt, "not indebted." They we called the general issne hecanse, by importing a general and absolnte denial of whit is alfeged in the declaration, they amount at once to an issle, by which is meat
side anil denied on the other.
General'ity, $n$. [Fr. géneralité; Lat. generalitas State of lieing general, or quality of including species, m-fjor part ; as, the "generalily of mankind." (Addison.) -That which is generad ; that which is other than special ; a general or vague statement, conilition, or phrase. "Let us descend from generalities to particulars."-Landor.
Gien'eralizable, $a$. That may be generalized, of Generalizationa $n$. Fr. gine or system. Gencralization, $n$. Fr. generalisution.] Act of or to their gedera.
" Generalization in only the appreluedsion of one in the manf.,"
Sir H. Hauation.
(Logic) The act of compreheoding under a commo name several oljects, arrecing in some point which wo abstract from each of theer, and which that common name serves to indicate. When we contemplateseveral ture, we can, by attending to that part alune, assign ture, we can, by attending to that part alone, nssign
them ede coinmon name, which will expresa or stand for thers all as far as they agred, and this is what $i$ called generalization. Another kind of generalization is from olserviog that, wheo two or more objects hatve certain thiugs or propertics in common, that therefore they have others also in common, as where Newton, from the fall of an apple, discovered the law of grivitatioe. In this process of generalizieg there is involved
a principle which experience does not furnish, by which a principle which experience does not furnish, by which
we affirm oot only that all heavy boulies which bave we affirm oot only that all heavy bulies which have
been observed grivitate, but thit all heavy bodies. been ebserved gravitate, but that all heavy bodies,
whether they have leeen observed or aot, do so. In this thethe is implied a belief that there exists a curtain order io nature, atod that, noder the samo circumstances, the bame snlustancee will present the same phenomena.
Generalize, $\boldsymbol{v}$, $\alpha$. [Fr. geniraliser.] To make general, or cumbin to n namber. - To extend from particnla
or species to genera.

by P'ruf stom of greneration. (1'hysiot,) A term applied with the made of reproduction of many of tho lower nobimids. In their development from the uvam to tha adult state, a largo number of these luejuss nut ouly pass thrungh varions stares, ins exeophified in the insect tribe, but also passess the power of multsplying then-
selves at ceretain periods of their krowth. The animal selves at certain periods of their growth. The amanal
which exhitit thas pecularity have been called nursoa Which exlibit thas peculiarity have been called nurses
and the phanomon hits been particularly oliserved
 work lyy the kiy Suriety, the ulternation of generations is inlly described. The midde of develophment by mutus of minses, or intermediate germerations, is shown to bo stance," be observer, "of as unimal giving lirth to a progeny pernaumetly dissimilar to its parent, but which itself prombees a uew generation, which either itself on
in its offspring retarns to the form of the parent and mal, is a $1^{\text {ihenomenon }}$ not contined to a single class or Beries of animats; the rertebrate class is the only one sequently mppear that there is sumuthing intrinsic is seyuentiy appear that there is soblething intrinsic is with a certuis pecessity; on which acconnt it will undoubtediy soon be recoraized to a greater extent and more generally. If the whale system of development ly means of " Dursing" generations be collected and re garcled in one view, it apprars, as the essential feature
in this course of developmuent, that the species is not folly represented in the sulitary, fall-grown, ferthle in divituats of both sexes, uor io their developmeot; but that to complete their representation, supplemeotary
iadividuals, as it were, of one or of $6 \cdot$ veral precedent iediviumals, as it were, of one or of beveral precedent generations are necessary. The greatest incompletebe ubserved in the Campunulario and similar polynets ie which the generations representing the muity of the species are very unlike each ether, and in which all the individnils are fused into an ontward ubity, or into a set of polypes... They exist orgaoically comaected with eath other, and are wormally free only in their first gencration, and, indecd, only in their earliest stago of 5 wimpung cilated enbryo swims abont in the water ut must fur some hours, in order to fiud a suitable place fur the fundation of a new pulype-stem. In the Corynas individnals ind pes, the organie consection between the fect gemmiparons or ckusemosindividnals ari. po pully quite free, offen even at au early a.for so that they do not attain their foll development mitil after their enplaration from the "ursing" getwerntions. In the Nectusic and S alpe, the geberations w hichare connected turether into one whole become more like each other. Amoms the Entozod, sionilar attempts at beconing free and accemplibhing a perfect growth are nlso described. The development of animals which do not belong to the Water, but to the air, also presents similar phenomena,
but in at still higher ind more free stage. The propasaunt in a still hightr ubt more freestage. The propaga-
tion of the A phides thruthg a series of generations has ton of the Aphaties Inrugh a series of generatioas has
been long kouw. In the spring. a generation is produced from the uva. which grows and is metamorphosed and, without a previons fertilization. gives birth to a new gener,tion, and this agatin to a third; and so on for ten or twelve we has; so that in certain species which At last there occurs a geveration consisting of mate and females, the former of whith, after their metamorphosis, are uspally winged; fertilization ami the deposition of eags take place, and the loog series of generit-
timns recoumences in the next yarr and in the same
order. order.

says Max Miller, "is a mere blunder: for the Greek word genike never meant genitivus. Genitivus, if it ie meant genike never meaat grnitus, Gempes the case of origin or birth, would in Greek bave bees called gernettlie, Dot genitie. An does the may $6 a y$ 'the son of thie father,' we may likewise suy
'the father of the son.' Genilie in Greek had a much 'the father of the $80 n$. Genilic in Greek had a much
wider, a much more philosoptical meaning. It meant casus, generalis, the general case, or, rather, the case which expresses the geous or kiad. This is the real power of the $G$. If I say, 'is hird of the witer. of the water'defines the genns to whichacertain wirubetonis; Science of Language.) In English, the geaitive or pos-
sesaive cass is marked by the addition of the letters preceded liy an apostrophe; as, the hing's son, ony father's horse. When the plural ends io s. the additional 8 of the $G$. is onitted (excepting sometimes in proper Gen'ito, in I'rginia, a post-village of Powhattan cn, on the Appomattox River, abont 29 m . W. of Richmond,

Geniture, n. [Fr., from lat. genitura, a begetting, from gigneri, to beget. Ther art of lereeting: keneration.
 ancient Komans to a class of spiritual heings which at tended npun man. Every bamau becing, necording to them, hat his special gonius alhoted to him nt birth, tor
gnide and dirvet him throngli lite, and has genural charghide and diruet him threnght hite, andinis kenerat char G. : hence the word ciane to blaniry the mataral powers and abilities of men, more enpectally their natarat inchimation or dieposition. In medern times it las conu to be employed in a still more restricted and aproinl senac, as siguitying the very highest condation of tho thenta puwers, the perfection of haman intelligence, Like many uther words of a similur hind, it is dithent or impassible to detine it in words; but there is alwiys assuAccording to Emerson, it is the " constructive intellect," which " jroduces thoughts, sentences, poems, pluns, designs, systems. It is the generation of the suind, the mirriagu of thought with nature." "The thought of $G$. is sponiancous, bat the power of picture or exprexsion in the most enriched and Howing nature implies a mixture of will, a certain control over the spontanco stites, without which no pradnction is possible. prodnces what has never before been accumpished: "it is the adrent of truth into the world, a form of
thonght now for the first time bursting inte the universs, thought now for the first time bursting inte the uutvers",
a child of the old eterval eonl, a piece of inmeasuralife a chilh of the old eterval sonl, a piece of immeasurahle greatuess. It chief facnittes are the reason and the
immerination, and according as ore or the other of these immerination, and according as one of the other of Ghese
faculties preduminates, it becomes either scientific or nrfistic. "In the first case it seizes at once those hidden uffinities which otherwise do not revest themselves exerpt to the most patient and rigorous application, atul, as it were, intnitively recognizing in phenomema the nalterathe and cternal, it prodnces truth." In the latter it seeks "to exhibit its own ideal in due mad appropriate forms; it realizes the infinite under finite types, and so creates ths brataful. G. 1 sumetimes uset signify that talent or aptitudo which we receive from
matore from excelling in any one thing whatever. Thas matore from excelling in any one thing woll as a $G$. for poetry ; of a $G$. for war, for puhtics, or mir aoy mechanical eopluyment. The distinctioncey: "Genins is that mode of intellectual power which moves in alliance with genial nators, i.e., with the capacities of pleasore and paio; whereas, talent hae no restige of elth rat allinace, nul is perfectly independeat of all hamm ecd represents the tutal nature of man, and theretore lis enjuying sod sofferiog nature; whilst, on the contrary, talent representa only a siogle fanetion of that nature, And hence, anso, it is, that, besides its redation to 61 f fering and enjoyment, $G$. nlways inplies a deeper relaof a relatien to moral qualities, any more than it has to of a relation to moral quanities, ana more than
vital sense."
(3yth.) Aecording to the Romans, not only every onan had his $G$., who, after guiding lion throms of his career; but placee, and even inanimate objects, were falled to have their genii. The collective Roman people also had their G., who was sometimus represented on
coins. Thuse of the wonten were called Junnacs. They coins. Thuse of the women were called Junnocs. They through life by two genii, a white and a black, the for mer guod and avortble, the latter bad and unfavormble black and white by turos. Divine honors were psid to the genit, and it was usual for each one to offer sacrifices to his $G$. on his birthday. - The grnii, or djiams, of the East bear little resemblance to those of the Romaos. They are regarded as no interonediate class of beings, between angels and men, bnt inferior in dignity to thoth, and are not oljects of worship. In poetry they are described as hating been created ont of fire, and as having inhalited this world before its oceupation hy man, as the subjects of a certain Juin How Jun. They rebelled, and Gud sent his aogel Dolis, or Eblis, who, after conquering Jin fon Jun, rebclled aganst God athd set husself np in his room; demmed him to eternal pomshment. They eat and dronk, are sulfect to passions and death, hut may live for centurics. They are capable of becoming invisible, or assnming the forms of men, beasts, or monsters, of pleaspre. They frequent buths, wells, ruiued houses sents, rivers, cross-ruads, and market-places. The evil genit delight in mischief for its own sake, raise and direct whirlwinds, and dry up the spirings of the dusert The ghouls are a snbordmate class of evil graii, hannting deserts atod Lurlal-gronods, and kiling and devour iog mest ind women that fati in their way. The perna and in slubamed his prophet, and do gosd to man The Mussylman ductors beliove in the oxistence of dimns as supernatural beings, hut their ideas of them differ mach from those of the poets and ronancers. - A term of complaisance. - A man of strict integrity iss well as of refined mannere aud comal breeding.
-One who serves a man of rank and atteode his person; as, he is my lord's gentleman (i. e. valet), a gentlemanusher, \&c.
(Hist.)
(Hust.) It is a matter of difficulty to give a correct definition of what entitles a mats to the appellation of G., or to determine a standard by which persons who clain to hold this rank may be distingnished from thuse who possess no right to it. The,original derivation of
the word is from the Lat. gentitis, helonging to a tribe or gens, and homin, a man. In the early ing of Rorse or gers, and homn, a man. In the early daye of Rorse,
the inhabitants of that city were divided into two clasers, - the populus, or that portion of the conmunity in whom all power lay, and the plebs, or comatomalty, whom all power lay, and the plebs, or combiomalty
The poputus, or body of the patricians or nublea, wha further divided into tribes or gentes, and each gens into families, all the members of which bore the common appellation of the tribe, To belong to a gens or tribe was to take rank among the nobles. and in after-times. when the privilege of admission to a tribe was conceded to men of plebeiaco origin, it was equivalent to the grant of a title of nobility by letters 1 ntent from the craun in our own tione. Ilence the term gentilis was applied born ancestors, and belonging to is molle framily; while born ancestors, and belonging to a boble framily; ") "hile
that of sine gente. (" withont tamily or etanding,") wus applied to menof low rank and origingnd thase that were burn of slaves. The term has been adopted in all European languages of which Latin forme the foundationstone and perent stock: while it is found in our own langnage in the word "gentletuau," and gives the clue to the mearing of the expression gentle, wall-horn, in contradistinction to its oppusite simple.

 the meridina between Aniens and Paris, and ubtnined a resnlt of $69-1$ Dinclish milcs as the kength of Hegreet
This was followed, in the commencement of the 1 sthi century, ly the extension of the measurement of the meridtan ligmu by Picurd, to Dunkirk tuwards tho N ., and Colifiore, in the Prences, towards the 8 , when Jimes Caxim, muder whose direction the operation was
completed, found the leneth of a degree hetwern Iharis and Dunkirk to be rather less than the restlit which was obtainell by Picard, and also less than the lebgth of a degree between Prania and Collioore, which guse rise te
an jilea that tha leugh of a derree of the meridnum nust grow less in proportion to ita distanee from the equater, instead of greater, as it must do of becessity,
if the firm of the carth be that of nu ollate spheroud. if the firm of the carth be that of min ollate spheruid.
This cansed Cassini ant others to conjecture that the earth must be in the form of a prolatic spherond; lut ment of an arc in 1536 , in Lapland, to the N. of the tiulf of Buthia, frum wbich it appeared that there was an of bethinia, rump wbich in appeared the length of a degree of the meridian in proportion to its distance from the oquator, nithough it was discovered that their compustutionerred in excess when a re-measuremeot of the arc
was made ly Svantery 1018 . Whate Mauperthis was was mande by Svantery 111 180, urasuring an are of the meridina in Lapland, Bunguer
and La Contanine, assisted by some Spanish officers, were performing the sime operation near Quito in Iteru, anl irum toise beint nised as the standird of measurement, whilh has sioce been adopted as the stambard to the expression of the leagtb of the grovater number of of Eunper, all of them, indeed, having licen nitmately referred to this ax the nuit of messoremest. In the measnicment of the arc efficted in lern, the lenget of a degree was found to be atout G8\%i2 Eoglish miles hy the rench mathomaticians, and rather more by the
Spaniards. The results, however, of the two measureneuts effected sinuitancously in Pern and Lapland went far to prove that the form of the earth was that of an ob-late splueruid. 1n 1552, Lacails measured an are of the
mortidin at the Cape of (iood Hope, from which opemeridian at the Cape of Good Hope, from which ope-
ration he obtained a result nearly equal to the length ration he obtained a result noarly equal to the length
of the degrees mensur-d by Picard bot ween Paris and of the degree mensur-d by Picard liborem ahout $30^{\circ}$ S. of the equator, while that part of Frumes selected by Picard is $50^{\circ}$ to the N of it; and according to the rethe length of the degree measured at the Cape oncht to have been less than that which was assiguet to it by Laccille. The discrepancy bans, however, been account-
 i:n of Paris was remosasured from Donkirk to Barceluna, by order of the Fremin Cunvention, to estallish the length of the metre, the nuw french standard of measnrempnt which was to bo the, ten-millienth part of a quadraut

 and makes the metre to be shorter than it shonld be by
a very smand and trifling fraction of its present length. The Fremeh miter hus luen used in the mensurement of the 1. \& Chast sursey, the hatuxt example. we he-

GEOG
GEOG
tongue.] (Bot.) The Earth-tongue, a genus of Fungales de'orrost earth, sod found in bogo and meadows. ie ognost, $\pi$. [Fr. gcognoste, from Gr. geognostes, from
gea, earth, thid gignoshein, to know.] A geologist ; ooe
conversant with the phenomena preseuted in the science of geology
Sieornos'tic, (ieornos'tical, a. Belonging or relating to a knowledge of the stractore of the earth
Geornimosy
ieos'mosy, $n$. [Fr. géognosie, from Gr. gea, earth, and gnusis, knowledge, from gignoskein, to kouw; Lat. nos-
cere.] A term sometimes still nsed as a synonym of geology, or more properly, of geology as restricted to boilt unnt them.
 gime, geourative, from genein, to be borth, to come iuto
being.]. The doctrine, or theory of the geauration or fortmation of the earth.
Cieosrapher, (je-og'ra-fer,) n. [Fr. glographe, from Gr. ged, earth, and gruphetn, to described one who is
versed in geography; one who compiles a treatise ot Geosraph'ie, Geograph'ieat, phique; L. L.geagraphucis: Gr.gengraphitos. See ahove] Relating to, or coataiuing, a description of the terra-
Georraplitealiy, adv. In a geographical mannerWeos'raphy, n. [Fr.giogruphie, trom Gr. geographia,
from gex, earth, aud graphem, to describe.] Tbat science from gé, earth, and graphem, to describe. hy meat of which we olstaia a knowledge of this earth tooth as it is in itself and as it is connected with asystem,
of other similar bodies. It comprisps a koowledge of of other similar bodies. It comprisps a koowledge of
its fignre som dimensious; of the natural features, diits fignre aod dimensious; of the natural feathres, dion
visione, and productions of ita snrface: of the postion of the varions places upon it ; and of its various inhabitants. It is usmally arraoged nuner three principni
branches, - Mathetnatical, Physical, atul Politiesl. Mathematical Geographyy deals with the earth priacipally in its pladetary relations as at menber of the solar sys-
tem, - a great part of this beiog common to it with as tronomy ; and hence it is sometines ternard astronomical geography. It treats of the firure, wagnitude, density, heavenly bodies which excrt an influence apon it ; the relative positions anl distances of the various place npon its surface; and the representation of the whole or
portions of its surfice upon gfobes or maps. By matheportious of its surfice uyon grobes or maps, By mather heing a little flatter at the poles than at any other part
of ita circumference; that its mean diameter is 7,913 Etglish miles, the equatorial exceeding the polar by 26 miles ; that its orbit around the eun ie slightly elliptical $\$ 5.000,000$ of miles thate from that luminary is iob 365 days, 5 hours, is nibutes, 59 seconds, the mean rate at which it travels being about 68,000 miles an hour that the earth has also a motion around ite own axis,
which it completes every twenty-four hours, nod that it revolves around the sun with its axis constantly incliged to the plage of its orbit at an aggle of $66^{\circ} 3 \not z^{\prime}$. To the former of these motions we are imbibted for day and
night; to the latter, for the vicissitudes of the ecasons. In order to determitie the relative positions of different places upon the birth't surfice, geogritphers have supposed certain lines or circles triced upon it. One of these the equator, being equally distant from both poles or points of rotation, divides the earth into two hemispheres, - the northern and southern. Another encir-
cling line, drawn at right angles to the cquator, and passing through the poles, divides it into the eastern and western hemiepheres. Parallel to the equator, and
numbered from it, ara the lises or degrees of latitudn, numbered from it, are the libes or degrees of latitudn's,
of which thereare ninety in the northerin, and as anay in of which thereare ninety it the northeri, and as anaty in
the sonthern heminphere. The equator is divided into 360 equal parts, and lines drawn perpendicalarly from 360 equal parts, ami lines drawn perpendicalarly from
the pointsof division to the poles coustitnte the lines or degrocs of longitule. They are numbered east and west from a certain meridian, as that of (Areenwich, Paris, ing through that place to the poles at rishtangles to the eqnator. All places lyiag in the name latitude lave equal lebith of day and night at the enme titne, white
all places in the sane makitude lume mid-d.y at the enme time. Degrees of latitude and longitude are of tho tame length at the egnator; but the former, on accom of the flattening of the surface of the globe, are slightly elongated towards the poles, while the latter gradually The leggth forgtis as they receste from the equator 69.06 Enclish males, Wach dearee is divided into 69 equal parts, termed minutes, and every minute into 60 equal parts, termed seconds; markel thas, $0, / \prime$. On majs, the tatitule is denoted liy tigures at the sides the longitude by figures at the top and bottom. The top of 14 map is the North, the hotlom the Sonth, the
right lasma the Eatst, an! the loft han the West. As the oarth revalves aromel the sun with its axis constantly iuclined to the plane of ite orbit at a considerable angla it follows that mesuu deseg not remaina perjuenticular to thu "quitur, lunt is one hulf of the year to the north
and thus other to the eouth of it. An samuigury circle, aurkug the sun's vortical ponition with regaril to the earth, is tominil the erliptic, and cuts the eqjuator ol liquily at two paints, terned, the equinoctinl points of rornit eruisux wocura on the 2 let of Mirch, the tutuual on thy 2lat of september. The eun is vertical
at different times of the year to all that portion of the earth's surface lyiug betwee $2 ; 0,28^{\prime} \mathbf{N}$. and $z^{\prime \prime} j^{\circ} 28^{\prime} \mathrm{S}$. of the equator, and this region being snloject to the greatest
anount of heat, is called the Torrd Zone, and is bounded on the north by a circle termed the Tropic of Caucer,
and on the south by another termed the Fropic of Capriand on the suath by another termed the Tropicor Capt cora. The sun is on the parallel
$218 t$ of June, and on the parallel of $23^{\circ}$
$28^{\prime} \mathrm{S}$. on the 21 st of December, -termed respectively the summer an Wituter solstice. From this iocliantion of the earth
axis it also follows that the whole region withio 230
28 of either pole, ur, ia otber words, above $66^{\circ} 22^{\prime}$ of N. or $S$, latitude, is for a certain period of the year involved in continual night or continual day. The durthern of these regions is termed the North Frigid Zoue, and is bounded by the Arctic Circle; the soutbert, the south Frigid Zote, and bounded by the Aatarctic circle. Between
the Tropic of Cancer aud the Arctic circle is the North the Tropic of Cancer aud the Arctic circle is the North Temperate Zone; and betweeth Southopic of Citpricore - Ihysical Gemgraphy comprehende a description of ing of hand und water, the different animal aod vegetable jprodncts ; climate, elevation, and direction of montatiophains, \&c. (Sce PHystcal Gevoasphy.) - Political Geo graphy deacribes the contitries and nations of the carth as they are politically divided, and deals with mankind in their social aspect and organization. It gives an
account of the laws and governuents of the different countries, their language, religion, civilization, resources, all whicb will be treated of nimer tho nimes of the dif ferent countries. Geography, in its practical application, "has for its otyect the determiuation of all those tacts, as to any givea conntry, which will enable ns to judge of its fitness to provide mas with food and to promote portace; for it is well hoown that outwarl circime portaoce ert a rery puapifest influcace upoo mankind The climate and physical cbaracteristics of a country determine, in a great measture, the nature of its inhabitants, and its prodnctions gnide their pursuits.- Hist The earliest idea formed of the earth by nations in primeval coudition secms to have been that it was a fia circular disc, surrounded on all sidee by water, aud covered by the heaveus as with a canopy, in the centre of
which their owa land was snpposed to be situated. Tho which their owa land was snpposed to be situated. The
Pboenicians were the first people who communicated to Pboenicians wero the first people who commanicated to
other nations a knowledge of distant lasds; and al other nations a knowledge of distant lands; and al
thongh little is known as to the exact period aod extent thongh little is known as to the exact period aod cxec ut Homer naviratel all parts of the Euxine, and peustrated beyond the limits of the Mediterrancan into the $W_{\text {estern }}$ Geain. No rapid wats the adyuoce of geographical koowledge between the age of the Homeric pocin (which may be regarded as representiog the ideas enter taiged at the commeucement of the 9 th ceutury n. c.) atu the time of Hesiod ( $800 \mathrm{n} . \mathrm{c}$.), that, while in the former the earth is supposed to resemble a circular slined, sam rounded by a rim of water, spoken of as the parint of all other streams, and the names of Asia and Earopo
applied only, the formur to the upper valley of the applied only, the formur to the upper valley of the
Caister, aud the latter to Grcece N . of Peloponnesus II esiod mentions parts of Italy, Sicily, Ganl, aud Spain and is acquainted with the Noythians, atod with the Ethiopian of S. Afrita. Durmg the 7th century B. C Nectio Thenicians, under the patronage of Neku, Necho If., king of Egypt, undertook a voyage uf disThe ith and 6th centaries B. c. were memorable for the great advance made iu regard to the knowledge of tha
form and extent of the earth. Thales, and his pupil Anax form and extent of the earth. Thales, and his pupil Anax imunder, reported to have heen the first to draw maps, exploded many errors, aud paved the way, by their obBervitione, for the attanment of asounder knuwledge fither of geograplyy as well as of bistory, a new ara hegan in regard to geographical knowiedge, for aithough hi chief pert which lie visited in his extensive travels, that his hintory wives us a complete representation of all that was known of tho earth's surface in hie are. In the next cent., the achiswemeote of Alcxamier the Great temded matecially to enlarge the bounds of hasan knowledge for white he carried his army to the broks of tho Indu and Oxus ; he at the sane time promuted scuance, by senling expeditions to explore and enrvey the vurion jroviaces which he subdued, atid to make conlections of all that was chrious in regard to the organic and inor
ganic producla of the newly unted territorice. An ingatic prodncta of the newly untited territories. An thenes ( $\mathrm{u} .276 \mathrm{~b}, \mathrm{c}$.$) , who first used parallels of longitude$ and latitnde, and constructed maps on mathematica principtes. 1)uring tho interval between the agns of works on geography were cotupiled, whith havo been only partially preserveal in tho recorde of the later writers. Stribu's grest work on geography luas bee considered ns a model of what such works should be in regard to the method of treating tho subject. The greatest errvice was done to gongruphical knewledgoby
tho gurviy of the Romun mmpire, which was Ingun liy Juline Cessur, and completed by Angustus. This work

 muy, and Africa, has left us a compondimin of the gens of hix Iisturid Naturalis whirh lie davitus to the sult-

the middle of the $2 d$ cent. of our ara. His work on $G$., perfect system of the science through the dark and middle system of twe sclellee cent, gives a tolerably cor rect account of the well-knuwn conatries of the world, aud of the Mediterranean, Euxiue, and Caspian eeas, but it added littlo to the kuowlalge of the N . of Earope, or the extreme bonualaries of Asitit or Atrica. Yet, from his time till the 1tth century, when the records of the
travels of the Venetian, Marco Polo, opened auw Fields of ingiry, be stateme har yolo, opeaed new belds of inquiry, the statements of Itweny were never quisamong a few German echolars at Xïrnberg that the strange accounts giren of distant tastern lands by the Venetian traveller were received as trustworthy where be diftered from Ptoleny. The momentons discovery of Atnericn by Columbns (1492), which had been precedell in 1486 by the exploration of the African coast as fur as the Cape of Good Hope (which was doubled by Vasco de Gama in 1497 ), was followed by a rapid enecession of discoveries; and within 30 years of the date
of the first voyage of Columbns, the whole const of of the first voyage of Columbus, the whole coast of plored, the Pacific Ocean liad been navigated, and the plorcd, circumas ocean had beca havignted, and the Africa, Arabia, Persia, and India had been vieited by the Portoguese, and oumerous islande in the Iudinn Oceao discovered. The 16 th cent. was narked by continued attempts, successfnl and nosuccesstul. to extend the ephere of oceanic discovery; and the desire to reach India by a shorter ronte than thuse by the Cape of Good Hope or Capo llorn, led to many atteoupts to diecover a
N.W. passuge, which, thongh tbey signally failed in N.W. passure, which, thongh tbey sigually failed in
their object, had the effect of very nuaterially enlarpiug our knowledge of the Arctic reginas. The expeditions of Wincurby aud Frubisber, In 1533 and 1576 , of Davis (1585), Hudson ( $160 i$ ), and Bnffin (1616), were the most and 1sth centurics gave a new thrn to the study of $G$ by bringing other sciences to bear upon it, which, in their turn derived clucidation from the extension of geo graphical knowletge; aud it is to the aid derived from history, astronomy, and the physical and natural sciences, that we owe the completeness which has characterized modern worke on 6 . In the 17 th cent., the Dutch, under Tasman ond Yan Diemen, made the Australasian islands known to the civilized world; and in the latter half of the 18th cent., Captain Cook extended the great ocemic explorations by the discovery of New Zealand and many of the Polyncsian greaps; hat he visited in 1840 by American, Eoglish, find renas first visited in 1840 by American, Euglish, and Fretch expe-
ditious, nader their respective commaders. Wilkes, Ross, and Damont d'Urville. This will probably prove to baye been among the last of great occanic discor eries; and tho atteation of explorers is now turned to the interior of the great contioente. In Anerica, the travels of Llumboldt, Lewis and Clark, Fremont, and others, have done minch to make us acquainted with broad general features, but mnch remains to be done it rugard to the special districte of Central and sontherd Anerica. Io Asia, numeronzs travellers, gengrapbers, and aaturalista have contributed to render onr knowi edge precise and curtain in ruspect to a great part of
the continent, whose natural characteristies more eapecially represented by the great physicist kit ter; while we owe a large delt of gratitnde to tho nished us with a rich whss of informadion io recurd to mitior details of Asiatic life and nature. Much light has been throws on the character and condition of the Africaa continent by many of its greategt explorcrs-a Brice, Park, Clupperton, Adambnt, the landers, Brke Burtoa, Speke, Barth, Vogel, Livingstone, Suas "y, Nach-
tigal, Duveyrier, Baines, be. In Anstralia the obseurity tigal, Duveyrier, Baines, de. In Anstratia the obscurity
which had hitherto hung over the interior bas been to which had bitherto hung over the interior has been to Eyre, Leichhardt, and the hrothers Gregory and etill more by the hors of Burke, Forrest, and Wirhur more by the lahore of Burke, Forrest, and Warbur-
ton, who have lad open moet of the secrets of the in terior of Australia. The progress which has nasiked terior of Australia. The progress which has marked
recent discovery has heen muterially aided by the en couragement and syst-matic orgnnization which have been given to plans of exploration by the public governments of different countrics, and by the efforts of the anmerous geographical watietirs which bave bevof formed during tho present century; while the constantly increasing mass uf information collected by aciontific explorers is rapidly diffusibg correct information in regard to distan regions, ami thas eflecthaliy dispeilitg the science of geography,

 $g g_{\text {, the the th, }}^{\text {trente of tho }}$, trente of tho stracture and history of the varth. It considers tho matare, the varions conditions hat order
of rurangement of the rocks and their cuntents; the of arrangement of the rocks and their contenta; the emetise crust, atul the causum that Induced them: umil describes the properos of life uputh its suffice, or tho natiro and order of intrombetion of ita vigetahle and
animal triben. In the exatuination and deacrigison of
the structure of the earth, applicstion must be made of a knowledige of oll the physical sciences: anil the fact that $G$. thus rests upos the matural sciences acconnts for its bress had been made in these sciences, the geolagist wonld lack the rueans becessary for ha investugations. When the chamist was able to explain the trite nature of the mineral substancea of which the rucks are composed; when the geographer and meteorulogist had explored the surface of the earth and learned the extent and the form of land and water, and the powers of wiuds, carreats, rains, glaviers, earthquakes, ado vol canoes; aud when the naturalist bad classiticd, named, and accurately described, the greater part of exiating animals and plants, and explained their physiological ad anatornical stracture, and tue law of thenr distriof arriving at sare and definite results, cotootebce his researcbes into the stracture and composition of rocks. resed the canses that prodoce them, or utilizo his discoveries of the remains of adimals and plant* that are eaclosed in them. Thea oaly coull he discriminate with certainty hetween ijneons and aqueous rucks, or Letween the remains of lividg or extinct species of animuls and plavts; and uatil then would he be unable to lay down any of the fonadations upon which the science of $G$. was to rest. G. Was formerly looked upon in the hght of a geograpaical mineratogy, and even yel is re gardedeed could hare anticipated, from the more stud of masses of stope and rock, - where, to a partial and local riew, all erems confusion and itregularity, - the wonderful order and harmony that arise from more ex teaded observation, and the almost romantic and seemingly fatulons history wbich becomes at leogth nafolded toour pernsal. To understatnd the records on which this bistory is founded, and to understand their meaning aright, frequent, long-cuntinuen, and widespread ouser vation and research in the field, and patient and concinuons registration of the ohserved facts, are absolately necessary. Inis coculiar bosiness of the reornest. The ditch, the catting, the quarry, tad the mine; the clift the gully, and the mountain sile are bis subjects. These he biss to stady, to examine, to descrihe the miontife of the structures they expose, and classify and arrange the facts they may afford, depictige their lineaments on maps and sections, and recording thera in written descriptivas. The onsiness of the geoganst, then, is to make out, from indications observed at the surface, and in matoral and artificial excavalions, the internal structare, the solid geometry of district after district, and coustry after country, until the whole earth bat heen explered and described. If, while so doing, be anderitand and explein how that structure bes been produced, he then hecomes a genlogist. It is one of the most remarkable results of geological science, that an acquaistance with organic, abd especially animal furms, is at least as necessary for a geologist, an a knowledge of minerals; and that a correct knowledge of organic retoains (portions of fossil plants and anmats) is a more ertain asd uncring gatde io onravelung the structur of complicated districts than the most wide and general acquaintance with inorganic substances. The cause of this Decesity may be stated as follows : When we sorue to examine heen produced in surcession. that it consists of a regular suries of earthy deposits (all called by geologists rocks) formed ode after another daring becesaive periods of time, each of ereat bot onknown duration. The animais and plants living at one periud of the earth's history were differeot from those living sow, and different from those living at other periods. There bas beet a continuous snccession of differeb races of living beings on the earth, following each other in a regular and ascertainatule order; and when that order has been ascertaised, it is olvions that we can at once assign to its proper place of production, and thereore toits proper phaco in the series of rocks, any por any one or even any recognizable fragment of one of these once liviag beinss. When we find a known forsil in any piece of rock, we are sure that that rock mast have bees formed during the periud when the anmal or plant of which that fossil is the remains was living on the glole, and could not have been formed either before that species canne intw existcnce or after it became extiact. In cases, therefore, where the origaval order of the rocks bas been confused by the action of disinrbing furces, or wbere the rocks themselves are only at rare and wide intervals expused to view, their order of depusitwa and consequent succossion or places may ination and determination of their fossil contents tham by any other method. Derriptive $G$ considers the facts and apprarances as presented in the rocky crust of the earth: Thporetical $G$. attempts to account for the phe nomenat, and arrange them into a connected world's listory : and Practical G., puider) in its researches by the other two, trats of the mineral products of the globe, the methois of oltaining them, and their application tu industrial or economic porposes. G. may also be conveniently studied under the three sut-sciencesPration of the groy, wbich treats of the surface configences ularly to a consideration of the mimeral sulastances which compese the crust of the earth; and Pitacomtology, which censiders exclusively the fessil remains found in the rocky strata. In $G$, the history of the
earth is divided, for convenient referencennd study, into periods manclifrom the provailing types of nummals or plants thed existimg. I. The nge preediug the appearzōm, llfe, - menting destitute of hife) The noic rocks are of ignoous origin, that is, woro unce in a otate of fosion. Therocks of sulnequent periods are of aqueons origin, or thposited in latyers or strata by the ar-tion of water. II. The Sulansolc nge (or. palatios, ancient, ant zoon, or age of amsumt life. This is audulivided into 1. The uge of Delluses, or the Silurian. 2. The age of fishes, or the Deronutn. 3. The age of coal plants, of the curoonifrous. 11T. The Mricasne ag. (dr. besos buiddic, and zeon), or the nge of reptiles. The Tenmamomals, $v$. The age of nata. Fach of those ages it describel nuder its proper head. The suldivisione under the ages, the furiods nul epochs, vary in difforent coumtries. The necompanving tahles (Firs, 1141 and 1142) taken from the Manual of Cieology, ly James D. Duna (the best gutde for those who aro anxious to study this grent aud useful departmunt of natural history), presents a geversl view (Fig. 1142) of these of easters N. America

Geom'etry, n. [Fr. géontetrie; Gr. geometria, from ge, earth, and metron, measare.] G. may be etrictly defined
to be the doctrine of the extension of euch things to lines, surfaces, and solids. The attritutes or properties of bodins may, in order to be more readily explained, bo resolved into two classes, one comprising the penera characteristics of all, and the other such oaly as are included in particnlar or peculiar bodes. Extension, figure, magnitude, molility, divisibility, inupenctrabiry Wright, and inertia, may be mentioned as ame or properties which belong to the hirst class; , whe sond are solidity, liquidity, transparency, and such like. Of all these properties mentioned,
only extension, magnitude, figare, and dirvsibility come only extension, magnitude, figare, and divisibiltty come
under the special branch of acience densminated Geometry; the different properties which remain coming under the head of Natural Philosophy, or Pbysics. Tho important science of $G$. was first cultivated in Egypt, dates its origin from the followinur circamstance: Sesose tris, the king of Egypt, shared the hands at Thebes aod Memphis between his subjects, and each portion was marked ont by different landmarks; but, owing to the
inundations of the Nile, these boupdaries were fre inundations of the Nile, these boundaries were frequently dentroyed, and it became oecessary, at often as a syetem was invented, which was termed $G$. Thales, philosopher who lifed some 640 years before Christ,
brought the science into 6 reece from Egypt, whither he brought the science into dreece from Egypt, whither he
had, it is ralated. gone in search of knowledge at rather a late period in life. He ia saill to have applied a circle to the oneasurement of angles, and to bave instituted
vanions conaparimons and relations between triangles, by means of their proportions; ono particular poiat be disangles, which most he looked upoo as in iomportan discovery, when it is taken into cousideration that the science was yet in ita infancy. After Thales came Anax-
imander, who is said to have invented geometrical imander, who is said to have invented geometrical
charto, und the sphere and gnomon; next followed Aucharts, und the sphere and gnomon; next followed An-
uximenes, who invented the sum-dial, and must thas uximenes, who invented the sun-dial, and must that
have becn acquanted both with istronumy and $G$ Pythagozas mortitur the theory repally during the nnder his centuries which elapsed after the introduction of G., mutil the echool of Plato took it iu hamb. Plato secms to have had the highest opinion of the science, and we read in the classics, that the inscrijtion, "Let no one ignorant of geometry, enter here," was placed over the portals of his school. The theory of Conic Sections dates its birth from the Platonic sehoole, and to the
same sonrce may be ascribed the beautiful theory of same sonrce may be ascribed the beautimi theory of hidden truthe which it coptains, but also from its im portance in the solution of problens. About 50 yeara which had hoen diarovered hy his predecessors, aud formed of them his famons Elementr ; a work which is stall regarded by many as the bent introdnetion to of which 13 are khown to have been written by Euchd ont the lith and 15 th are supposed to luve been added by llypaicles of Alexandria, Apollonils of Perga, ahout 250 years a. c., comproed a trentise on the conic
section, in $*$ trooks ; and he is said to have been the first who applied to those carves the uppellations by which
thry hutve ever since been distinguinhed, namely: the thiy hutve "vor since been distinguihhed, namely: the
paraloola, the ellipse, and the hyperbula. (See Cosic Secparathela, the ellipse, and the haperbuta. (See Conic sec-
Thoss.) Alumt the same tine flomriahed Archimethen the most iltustrions of the ancreat phitosophers. II distmenished himself in f. by the discovery of the bean tiful relations betwerll the sphere and cylinder, by his
wonk on conoids anu spheroids, ly his discovery of the exmet quadrature of the paraboli, and of the upproxiwhich have rume down to ure times in cunnection with $G$., we may mention Euduxils, Archytias, Brimbothenes, Aristarchas, Dinostratus, and Niconselow; but for an acconnt of the discoveries or inventions by which they

will ever be remarkahle, as containing the first bys tematic application of Algebra to the solution of genouetrical propobitions. Sounaiter this followed the ascovery present $G$. has shared in the general progress of al the mathematical sciences, Bebides Montuchs work CLables' Apercu Historyue (Brussels, 1837 ) may be cotisulted with advatage with respect to the urigia aud
development of geometrical methods. Of the workn on Apcient Geometry the tollowing nay be mentioued Euclid, Elements of Geometry, aud Bork of Data; Apol lomins, Conics; Archimedes, Opera; Pappns, MathewaOpera ; K. Simson, Operu Reliqua aud Loci Plani Stewart, Propositiones Geometrice: ; T-Simpson, Elenent of Geometry; Legeudre, Elements of Geometry; Leslie Elements of Geometry, de. For an scconnt of the nu-
merous editions of Euclid's Elements (which Lave been merous editions of Euchd's Elements (Which Lave been
translated into every Europeas laoguage), see Murhard, translated into every European latoguage), see Murhard
Bibliotheca Mathematicu ; but to the list contained in that work should be added the more recent edition of Peyrard, 20 Greek, Latin, and Freucl (Paris, 1814). An edition of the first 6 booke, in Greek and Latin, by Camerer and Ifauler (Berlin, $1 \times 24$ ), alfo deserves to be noticed, on acconnt of the valuable notes with which it is accoapanied. The modern works on Algebraie or Coordisate $G$. are very numerons; we can only mention thuse ot Pliucker, Aualyt,-Geom, Entwickelangen, $1820-31$, System der Analyt. Geom., I835 and 1s5t, Theorie der Algebraischen Carven, 1839, and Mobius' Barycentrische

goage III., b. 1738. He was the son of Frederick Lauis, Prince of W ales, and succeedell his graudfather George II. in 1760 . In the early part of has reigu he gained brilliant 8uccenses over France aod Austria, in the Seven Yeara'
$W$ ar, and in 1763 conctoded an advantageons peace, which however did not fully satisfy the conntry. In liot George Greuville succeenfed to Lord Bnte as premier, and colonies, the consequences of which to the Aneriroentuns; sud the Americun Stamp Act was pased the following yeur. The aspect of aftains grew more nerious every day, and public discontent was at its height when at the cluse of the yuar 1769 , Junius published his fimund letter to the king. At the begianing of 1710 the popular clamor kept pace with manisterial folly blood had been alreaty tpilled in America; and the city of London delivered a hold and spirited address and reoonstrance to the king, which the king replied to in terms expressive of bis displeasure. After a lung and fruitlebs war, the independence of the Enited States
was ackuowledged. 101582 Lord Shelbnrne was placed was acknowledged. 10 1782, Lord Shelbnrne was placed of Chatham, as Chancellor of the Exchequer. In $17 \times 3$, the memorable coalitive ministry between Mr. Fox and Lord North was formed. To this the king wis decidedly hostile; and as soon as Mr. Fox's India bill had been rejected by the Lords, he aent a message to him and Lord Nurth, commanding them imnediately to return him their 6 eals of office, by a messenger, as a personal interview with then wonld be disugrecable to him. Oo the following day Mr. Pitt became prime minister; end the firmness which the king had displeyed in the affair, and the intrepidity with which he opposed the coalition, gained bin considerable popnlarity. In 1789 the kiog the begioning of Nov, till the following fels A war the begioning of Nov, till the following beb. A war and the views of bas ministers met with the king's fall and the views of 128 milusters met with the king s finl concorreace. In 1498, public distress appeared to have In 1800 the Act of Uuino between Great Britain and Ireland was passed; and in order to bring these over who oppused the meanure, the mimsters ulfowed a tacit understunding to prevail, that it weuld be followed liy certain political coucessions. G., however, could never be perstuded that be could admit the Catholice to political power, witbout violating the spirit of his coronation oath, - the consequence or which was, the retireand the formation of a ministry headed by Mr Addington. Negotiations were now speedily chtered into, which led to the treaty of Amiens. The king, bowever, consented to it with great reluctance. It was, in fact, very nopopolar; and when the resumption of hostilities took place in 1803 there was an evident demonstration of public satisfaction throughout all ranks. The Addiugton administration proved incompetent to their task, and Mr. Pitt, in 1N04, again touk the helm of etate; but hedied in 1806 , and the Grenville part $y$, which Fux had joined, wentinto oflace. In 1807 , Lord firenville and his colleagues attempted to change the king's opininstiexible, which led to the ejection of the Fox and $G$. Was ville party, and the Perceval administration sneceeded them. The death of his youngest nud darline child, the lrincess Amelia, which happened fowards the clowe of 1810, cave the kiug a shock from which be never recovered. The insanity, which already more than once had visited him, returned, and assnmed so violent a char. acter that but slight hopes were eatertiance of his recovery. The renainitg years of the king e life are
little mure than a blank in biography, for his lucid inlittle mure than a blank in biography, for his lncid in-
tervals were "short, and far leetween; " but it is said tervals were "short, and far letween; " but it is said that in. 1814 , when the allied novernigns visited England, he exinced indicatione of retnrning reason, and even ex-
pressed a wish to see the roynl visitors - a wish which it was not deemed proper to indulge. At leagth deafness was added to bis other calamities, and his mauner and appearance are deseribed ar pitiable in the extreme. On the lith of Nos., 1818, the queen died; bnt the king subsequent acquainted wimh Duke of lork to the office of custos of his person; on the:29th of lan., 1N:20, be breathed lus lant, in the s.2d year of his age, and the 60th of his reigh. of Balam; pop, aht, 4,000 . Gerfialcons, or Jea-Falcon, n. [Fr. gerfaut.] (Zoil.) The Futco Gyrfalca, a species of falcon, (see Eig. 987, considered as the boldest and most besutiful of the
tribe. lo siza it approaches closely to that of the osprey. Its general color is browaish-gray, of varied tints above and white beneath, nud brown longitudinal syots. The tail is crossed with a number of deeper and lighter bands, and the bill and legs are usually of a pale-blue or yellowish color. Three varieties
of the gerfalcou are mentioned by Buffon; the lirst two of the gerfalcou are mentioned by Baffon; the lirst two
are similar to the species above described, nad the thitd are similar to the species above described, and the third
is entirely white. The gerfatcon is a native of Russia, is entirely white. The gerfatcon is a native or fusbia, hirds, except the cagle, it is considered the most formidable, the anost active, and the aust iutrepid: it attacks the largest birds boldly, and when transterred from the coldest climate to the warmest, its strength is not di mioished, aor is its vivacity checked in any degree. Strasbure, islif. At AEDricu, a French chenist, b. at Polytechaic School of Carlerahe, where his attendance at Professor Walchner's Juctures first awakeoed in his mind a tasts for chemistry. Aiter two yeare residence in this towa, he rewoved to Leipsic, where be attended the lectores of Erdmann, which seem to herve developed chemistry. lie worked afterwurds for 18 months io the haboristory of Oicssen, noder Luebir's superintendence and in 1838 he arrived in Paris, where he was cordially welcomed by Dumas. Here he gave lectures und inetroctions in chemistry, und, with Chevreul's permission, worked in the laboratury of the Jardin des Plantes, where he commenced his important resesrches on the tessential oils. In 1 b +1 , be was appoioted professor of general chemistry ia the faculty of sciencesat Montpelier. Alvut this time, be published his rrects de chimiz Organique, is Which be sketcbes the idea of "homologons and heterologons series (q. v.), which st a later period be so and returned to Paris where cotablished, between the years 1849 and $1855^{\circ}$, io saccessive mennoirs, his view of series and the theory of thes, with which his nawa will be ever associated in the bistory of chemistry. was tbere, also, that he gave to the scieatific world his remarkahle rescarches upon the aohydrons acids and the oxides. All his ideas and his discoveries are embodied in his Traite de Chimie Organique (1550-1856, vole.) He had hardly conipleted the correction of the last proof of this great work, when, after an illness of
Ger'hardt's Notations
Ger'hardi's Notation, $n$. (Chem.) A method of exprexsigg chamical formula, dittering from that in of certain elements. By comparing tbe specific gravities of elements with their equivalent numbers, it will be seen that in a few cases there is a discrepancy between them; - thus:

Mydrogen
Gxygen.
Sulphar
suphar
Chlorine

| Equiv. |
| :---: |
| 1 |
| 8 |
| 16 |

Bromine ...................................... 80 79.8
To remove this anomaly, the French chemist Gerhardt donbles the equivalent numbere of oxygea, sulphur
carbon, seledium, rud telhrinm, on the assumption that "equal volnmes of elementary gases and vapors contaio the same number of atoms when conpared noder the same conditions of heas and pressare." This is equivalent to saying that the atoms of oxygen weigh 16 timen as much as atoms of hydrugen, though of the same bulk or volame, since a cubic foot of oxygen weighe 16 tibat as heavy as a cnbic foot of hydrogen. These doubled eqnivalents are gencrully indicated by a line drawr
throngh the letter;-thus, $\theta, \Theta, \forall \mathrm{G}, ~ \& \mathrm{c}$. Gt the com ponads mentioned velow, the formula are given accordponads meationed below, the for

Ger'man (inth'olies, $n$. pl. (E.cl. Hist.) The name of a religious sect whrli hiss recently burn formed in
Germany, hy secescion from the Ruman Catholi Church. It origimated in $a$ proclunation of a aperi pilgrimuge and service of Bishup Arnsidi, of Treves, t gion of sins. This proceerling called forth in lutter from Juhannea Ronge, an excommanicatel pricat of Silestia dated Octoher I, 18+1, characterizing it us an infolatrou* festival, nud calling upon the bishop to suppress it. short time lefore, another Catholic pripat, Jolinn Czerekl, huls serellad frimn the Komich Charch, unt nttempted the foundution of an indepondent Chriatlan consregation. The lotter of flomgo met with muny sympathizers, and a unisn having been effected bet wern
konge and Czerski, a puntrer of enngregations sprang konge and Czerski, a munther of congragations sprang
up in a very ehort time, calling themwelven German Catholliss. The "Confession of Schncillemilhi," drawn up hy Czerkki, Oct. 19, atul presented to tho govern-
 a mercly luman ordmance, the recerpton by the priente alonut of the lamis supper in luth kinds; the ennonpurantory: fasting: the nes of the latin longmage in divine service; mas hat voppers; the celifincy of the priente; the probithition of mixed marriages: the
enpremacy of the lope, and other pointe. They de-
clared themselves determined to sever their connectiou with the Pope, to receive the Lord's supper in both kiods, and to recognize the Bible as the ouly rule of faith. Tbey retanned the seven sacraments and the mass, which they celebrated the veruacular tongue of Rouge, proceeded farther than that of Schneidemiihl - claiming free investigetion of the Biblu, and frumiom of beliet for every individunl memher. It regroded as essential doctrioes only, - belief in God, the Crestor aod Governor of the world; io Jesus Christ, as having, ly his doctrine, his life aud desth, redeemed med from sia and misery, and io the intrueace of the foly spirt upon earth. Of the sacrameuta of the Cathohic Chiarch it retained ouly baptism and the Lord's supper. A council met at Leipsic on the 22 d of March. 1845 , in which Roage, Czerski, aod the delegates of twenty based principally papon the Confresion of Breslan After that time the prisciples of German Catholicism spread rery rapidly, being adopted not only by matay fonan Catholic priests, but also by many Protestant clercymen and laymen. At the end of 1815 , they comprised about 300 congregations. They, however, met with much opposition from the various govermments, and many vexations and restrictions were inposed upun them is Prussia, Saxony, Bavaria, nnd other States. A more serious source of disquiet, however, arose among
themselves. It has been seen that the tendency of Czerski was towards the doctrines aod rituals of the Czerski was towards the doctrines and rituals of the Church of Rome, Ronge, onthe other hand, approne this way, arose among the body, which was very prejudicial way, arose amoug the body, whica was vade to unite both
to their progress. Ao atteDipt was math parties in as assembly at Rawiez, in the munth of took part, but it had uot the desired effect. The cungregatious sympathiziog with Czerski met at Sclueidemith in the month of July in the same year, is oruer to efiect a cluser orgadzation amomen that prevailed nimong them, they were unable to come to any agreement. Nur were tbe followers of Ronge more successful io their attempts to effect the same oltended by deputies from 151 congregations, and new efforts wera made to accomplish a uaion of the two parties, but with little better success. The revolution of 1818 was fatvorable to the German Catholics, and generally ted to the removal of sume of the civil restric tions to which they were subjected. A conference was held at Köthen in 1850, at which uo alliance was pro posed with the free congregations which had formed themselves by secession from the Proturtant churches; sud a diet was fixed for 1852: but it did not nueet. since that time German Catholicism has been on the dechine, partly oa account of interan dissensions, wom party from oupressivo measures adupted aganst them disbanded, while others have gove over in a body to the Protestant Church. A conference was held at Ootlin Sept. 10,1838 , at which, however, oaly forty two repre
sentatives were present. The history of $G . C$ is lully given by Kampe, Geschichte der-religiäsen Beweguagen der newern Zeit, (vol. iii., Leipsic, 1856.)

## ier'manism, $n$. Au idiom peculiar to the German

erman Langnage and Literatnre. Ger., Deutsche Sproche und Lilrotur. $]$ Ibe Gerwan language is a branch of the ludo-Germanic class of laaguages, which separated from the parent stuck at a very early period. The Germans called the language Deutsel, or Yeutsch, from their nacestors, the Teutons, In its Widest senbe the Tedinorion, and the Southern, or Ger man. The latter has three subdivisions, - the Eastern or Gothic, the High Germon, and the Low German. The Gothic is the carliest of these of which we possess any litegary remaias, there being still in existence portions of a translatiou of the Bitle into Gothic made by Bislop Ulflas in the ith century ; but we possess nothing of the Iligh or Low German till the 7th century. Hence many persons have been led to regard the Gothic as tha origiual eource of the Gerbinn; but, according to Max
Dijller, the grammatical differeaces hetween the two Diviller, the grammatical differences hetween the two
nre of such a nature as to show that this was impossihle. "There never was," he says, "a common uniform Teutonic language, nor is there any evidence to show hint there existed at any time a puifirm him Germati of Low Germat hanguage, from which all Ligh German Gothe language died out io the gth century. The Low Gerusao (I'tutt-Dentsch) comprehends miny dialects iu the north or lowlands of Germany, as well as the Frisian, Dutch, and Flemish dialects. The oldest literary docanent of Low German on the continent is the Christian epic the Heljond, (Heater or Savimur,) which is preserved to us in two MSS. of the 9th ceatury. There are traces of a certain amount of literature it Sax on or Low German from that time onward, through the Niddle Ages, up to the lith century, but, hittie of lation of the Bibla luy Luther into llieh German, the fate of Low Geruma litarature was sealed. Iligh, Ger mate (Hoch-Deatsch) has been the literary language of Germany ever siace the days of Charluagne. Its history may be traced through three periods, - the old High German. extendiag from the 7th to the 12th century; the Middle IIgh German, from the 12th century
to the time of Luther: and the New Hibh Gemman, from to the time of Luther: and the New Hifh German, from
Luther dowa to the present time. In the present day Luther dowa to the present time. In the present day
there ere varions dialecte of the German ${ }^{\text {phen }}$ in difthere ere varions dialecte of the German plu-hce in dif-
ferent parts of the cunotry; as the Suabino, Bavarian, Frabcodian, Saxon, de. (sce Miller s Lecturrs on the Science of Language.) The earliest existing monument Gothic by Vlfilas, Blreudy alluded to After the Gothio language ceased to be spoken, nothing was known of thos work uutil toward the close of the l6tli cent., when a portion of it - namely, the Fuor Gospels - was found in the abbey of Werden. The letters are in silver upon purple vellum; whence it is called the Corlex Argenl-us, and it is now jreserved in the library of Tpealn. Afterwhrds, in 1818, the Epistles of St. Panl, of the same work, were discovered ly Cardinal Mai and Connt Castiglione in the monastery of Bubbio, in Lombarily. Of the tramslation of the Old Tustament only a few lines renuain. The eariest litcrature of Germany is know to us only by report or tralition. According tw Tacitus, is his time, the praises of their untional deity Tuisco in his time, the praises of their national deity Tuisco, heroes. When the nations began to mignute, heroce of greater nod greater renown mareh into the scene of song, nad the historic forme of Attiln, Theotoric, (ilinther, and others, nppenr. The two Dust ancient Ger man poems are the Loy of Ifldebrand ond IVadubrand
and the Proyer of Wressonhrun, which lelong to the 8th century. Many of the legende of thin period were afterwards embodi d in the lay of the Nifolungen, the mist celelrated production of German medieval poetry. The intruduction of Cliriminnity exercised au imprortant language came to fie that of the chutch, the court, sud the law. A kind of religious peetry, after the model of the ltoman puets, wha introduced in place of the ancion the loman phets, wins introsuced in phace of the ancion
berol court as well is by the clergy. founder of the so-called Silesim sciow is the nue repre founder of the so-called silesinn scnoof, is the ti ne repres
scutative of the clission) poetry of the 17 th century. Il sentative of the clissical poetry of the lith century. He
was a scholar nod a gentleman, nost correct in lis lat ghageand versifiention, never venturing on ground which of Grecce, Rome, Frabce, Ihollaui, or Italy. Literary su cieties were formed at several of the cuorts of Germany professed!y for the improvement of the lamguage and poetry of the country, ufter the model of those of Italy grow . The "Firot Silesian Schuol" is rupresentell by men like opitz and Weokherlin, and is characterizud io psendu-classical. It was imitated in the north of Germany by Sinwa Dach, laul Flemming, ind a anouber of
less gifted poets, who form the "Kiuigsberg behool." The chice heroes of the " Srenad Silesian echool" are Hoffthanowaldau and Lohenstein, whose composition then those of Opitz; lut also morcdisappointing. There timu thosere of these schools, as Friedrich von Lugan. Aodreas Gry phims, and Moscherasch. Anong the other works of this perion, we may mention the Simplicissimus, in nove Giviug a lively pictare of Gernian of Professor Schupp the historical wolks of Puffendorf; the pietistic se mons of Spuner aud of Frauke, the founder of the orphen
school at ILatle; Professor Arnold's ecclesinstical his tory; the bist political pamphlets of Prof. Thomusill niog, and Leilnitz at the end of the ceutary. The 181 h century was marked by a revolution is the literatur suid modes of thought in Germany. Jobann Christulh part of thi, professor of eloquence at heipsic. in the eritic and was the oreany of defeating the Second silesian school. Ile was, however, an advocate of Freoch mudele in art and poetry; and it wits tbrough the opposition
which ho ronsed liy his Gullomaniat, That Germatn pone try was at last delivered from the trammels of that for eign school. Guttsched and his friends at Leipsic wer
opposed lyy Bodmer and his friends in Switzerland, wh opposed ly Bodmer and his friends in Switzerlatd, wh
advacated the English style of literature; and a lon biterary warfare was cariou on. Furalone period Goll oched and bis party prevaited: but at length public tur lived to become the laughing-stock of Germany Among those who distingnished themselves as atvorates of the new school were Gairtner, Gellert, Kartner, Adols
Srhlegel (father of the brothers Scblegel), Kleist, and Gleim. Of greater inffuence, however, than any of these bere named, were Ilagedorn of Hambints, whose fables and songy lave immortalizet him in Germany ; and A bert won Inaller, the physimmgist. remat kallie also as A literary descriptive and dilactic poetry. Dariog thi literary etraggle, the great thmes of factman pery spramg np, - Klopstock, Widani, Lessing, Worder,
Geathe and schiller. Klopatocks. Messiah made a profound impression by ite mystic, devont, ind rupturiaz
faith, as well as a work of art. The fashionalle and elegint purtion of socicty was attracted by the semiGrecinn, seni-Praisian mise of Wieland. But it was re served for Lessing to give a new direction to furman
literature. He estahlishom a new school of criticism. and exerted a powerfill influmse upan the progrese inf the drama, by nufolding, for the first time, to the fipr-

6ier'minn H1nilsu'oplly, the philosophic spirlt which comparatively modern origin. The ofd seholastic
forms retained their place here long after they had been forsakea in France and England. The writings of Lord Bacon, of Descartee, and of Spinoza, which did so muck for philosuphy in their owu countries, had but little influence io Germany. It was more particularly the writings of Locke which first excited any considerable degree of attention. His empiriciom, which sought to the opposition of Leibsitz, the first German that made an epuch in the history of the new philosophy, and who from the influence which he exerted un ahl sides, musi be regarded as the originator of the philosophic epiri in Germany. Yet the fundamentals of his systemmonodology, preestablished harmony, the doctrine of innate ideas-wanted a strong systematic basis, being rather gedial hypotheseg than regulariy estahlished pro-
positions. This defect Chr. Woll eet himeelf to remedy, positions. This defect Chr. Wolf eet himeelf to remedy, and sought to establish a system of phinosoply con-
plete in all its parts, accordiag to the rules of strict plete in all its parts, accordiag to the rules of strict which most particularly characterized the system of Leibnitz. The wide circulation of his writings, the high esteen in which he was held by hie contempora show the great influence which Wolf exerted for a time He was destined, however, to outlive his repntation, for there eonn came on a period of philosophical deaduess in Germany, during which a kind of eclecticism, devoid of principle, prev,.iled,-the eo-called "philosophy of
common sense," borrowed from the English and French common sense, borrowed from the English and reach
philusophers of the 1sth cent. Nevertheless, there also philosophers of the 1sth cent. Nevertheless, there also
existed great mental activity of certain kinds. Pooctry, existed great mental activity of certain kindo.
the reform of education, pulitice, and religious enlightanment, deeply occupied men's minds; old customs in family, and pulitical life were shaken, and a great and fhorough movement was preparing itself in the quiet. With Elumanuel Kant begins the more modern putiod tigue of Pure Reason (Kritik der reinen Sernunft) was in danger of beiug overlooked, yet, after a time, this and the principal of bis other critical worke, which, after loug preparation, nade their appearance in rapid suc,
cession, faye a powerful etimulus to scientikc research cession, gave a powerful etimulus to scientibc researchprehensiveness of hie investigations, but in that they exactly corresponded with the tendencies of the age at the time. Excluding all dogmatism aud fanaticism, main-
taining the independence of speculative inquiry, refertaining the independence of speculative inquiry, reter-
ring all theoretical speculation to tha accesible region ring ail theoretical speculation to tha accessilue regron
of experience, the elevation of tha moral to the highest and niltinate of ah human endeavor, - these in generat constitnte tho main features of his philosopby, which he wished to be cultivated rather with a view to its nocial than to its mere philosophic importance. He also entertained the hope that, by means of critical investigations into the mature of the human mind, it might he poesible to reconcile the opposing systembs of ampiricien and ra-
tionalism, of sensualism and epiritualiem, \&c., and to tionalism, of gensualism and epiritualiam, \&c, and to
discover a series of cotaprehensive principles to which discover a series of cotaprehensive pinciples might be
the controversies of the philosophic echools mithe referced in the last inetance. That this hope was disappointed was owing to this, that Kant eonght to supapport the old metaphysic of the schools by a psychology which itself rested on tha basis of that metaphytic. Be sides, there was wanting in the heyday of Kumtism any sufficient point of unity for the eeveral parts of philosophy. Of this want K. L. Heinhold was the first to sidemus, anst dogs and scepticism, as in Schuzes Ane and others, cogastism, in the writige the thow triumphant criticisin. J. G. Fichte helieved that ha had found that absolute point of unity which the criticism Yichte thallo Fichte, traveming on he path whice Kant had poiated idealism, while he declared the "Ego" to be, not only the idearer and source of knowledge, but also the only reality, the represeptation and act of which is the world. In the Erpo, koowing and being wora identical; it was at ature appeared only no the reflex of ite alseoluto mo tivity. With this idealism began a kind of revolutionary excitement among the phalosophic minds of Ger many, which contrasted strongly with the quiet an soher spirit of Kant. System followed eystem, phild euphic fiteratura became overwhelning, and the pmic meteora which made thir appearance in tho philosophic heavelus of Germany for the moxt part disatpeared sudtenly as they lad blazed forth. Schelling wis th first to exert it more goneral inflience, and changed th fiealism of Fichte, under the inlluence of Spinoza (wh hat been aguia brought into notico ly Jacoli), into the ho-culled philhspphy of identity. This syetem set oun orikinnily with the assertion that, an Fichte hand delucc
paturo trom the Eigo, sa, by reversing the process, th Eko may bo dednced from uature; that looth forms of philosophy find their busis in the alnonhte, as the iden ity of all opposites, - the ideal and real, subject and sertion, Sehelling nastigned fatellectual inthition na alono corresponding to the atsolnto ; yen, as representing, and Identical with, the absolnte itself. The orcan of this ntuition was culled resuan and, ha such, was uppuseli os the rettection of the underntanding, which wis hech to be quite incapable of comprehenuling absolute iilun-
tity. The relation of tho netnal phenomenal worlil to the abselnte was held to conamint ln this, that the litter
 the lather, \&c. Ho songht to demonstrato this identity
in non-identity, and uon-identity in identity,-especially Ger'mantown, in Tennesser, a post-village of Shelby with regard to nataral plilosophy in special cases, in are entitled is the having oppuseal the empiricism of mere observation and computation in natural investigations, and to lave contributed to the awakened intereb in the natural sciences. For in contemning experienc and reflection, occasion Was also afforded to a ranciful ther in common with science than the name, and on this account many dark opinions in the regions of poetry, religion, and social life came to maite themselves with the philosophy of Schelling. and which often led to the most strange aberrations into romanticiem, nyysticism, and a tendency to Catholicism. Tu philosophy of IIege also asserted itself, and attempted to develop in regnlar alsoccession the contents of the intellectual intuition by the dialectic method. He iodeed threw off the lawless play of fanciful combinations; Lut he sought for the expression of speculative thought, not in those laws of the connection of thought which have been recogrized for thousands of years, but in a dialectic, the essence of which coneists in the analyses of all the eetablished principles of thought, and whose process consists thereiu that every conception generates ont of itself its op-
posite, and uniting this with itself, inwardly enriche posite, and uniting this with itself, inwardly enriches Thelf, and in this way proceeds to still higher stages itself; Hegel, with enduring pergeverance, sought to carry out through the whole held of philosophic ioqniry aod divided his bystem into the three provinces of logic, the philosophy of nature, and the philosophy of mind While the systems above mentioned form a tolerably straight line of progress, there arose certain other bysteme, as that of J. F. Herbart, in opposition to the idar to the philosophy of the time. Herbart, Schelling, ned llegel are the only thinkers that can clain to bave exerted any general ioffnenca since tha time of Kant Among the numerous other thinkers of this time, who were chielly occupied in defeudiag or remodelling the older systems, we man tha development of the Kiauters wystew; Stefleus, Oken, Schubert $F$ ron Bualer, und Eschenmayer, who wera employed chietly in physical Eschenmayer, who wera empleyed chesibit systematicully the philosophy of Jacobi; the differeut sttempts to briug back plalosophy to an empirical psychology the peculiar speculativa attempts of schiejermacher, $J$ J. Wagner, Krause, Weisse, the younger Fichte, Bradise E. Reinhold, A. Tremdelenburg, II. Kitter, A. Günther and others; the different tendeucies within the Hegelian school ; and, finally, the relation which Schelling lat terly took up to his own earlier teaching, as well as to that which had been developed out of them. In the sama proportion in which during the last fifty years the acience of philosophy has been prosecuted in Germany, has also ite histury been studied; and indeed the Ger
mans were tha first who sought to comprebend and mans were the hirst who sought to comprebend aud throw light upon the more importunt parts of it by val uable special treatises. The rapid change in the philosophic systems, and the extravagances which characterized sume of them, have often been much blamed and mada eport of, abil it seeme, as a consequenca of tbat that there has been for somu tima a lall iu the interest taken in ejeculation, and a sort of sceptical aversion $t$. all proper philosophic iuquiry has takea the placa of the former enthusham. Het tho inmence of phas phy elevatiug and strengtnening the scioncind thera ioulmust no region of inquiry in which a deeper and more thorourh mode of treatment is manifest as tha fruits of thi philusophic spirit

Gev'many. [Ger. Deutschland, or Teutschland; Fr Allewkyne; It. Germania, Slavonia.] The word G. ie as uncertain in its derivation, as it is often vague and eelves Deutsche, or Pentsche, and their country Deutschland. The first syllable of this name is derived by those who use this urthography from the verb deuten, signifying to interpret or explain ${ }^{80}$ that Deulsche neans the people who were intelligible to one another, in contradiatiuction to Welsche (Welsh), or Celtic nations, whose language they did not underntand. Those who write Teutschland derive the name of the country from the god Tuisco or Teut, mentioned by Tacitus. Tho Latin denomination of the conntry, which Engliebspeaking people have adopted, is supposed to be derived woh the Roman which signifies soldier - the character in which the Germane wers nostly known to the ltomans The extent of conntry comprised under the term Germany has varied in every century siuce it first became known to the Romane. At the present time G, comprises the chief countries of Central Europe, and is bounded N. by Denrmark and the Baltic; E. by Yrussian Poland, Galicia, and Hungary; S. by italy and Switzerland ; and W. by France, Belgium, the Netherlands, and the North Sea or German Ocean.-Pul. Div. The aucient Germunic enpire, dissolved in 1 sot , and reconstituted as a confederacy of 39 states (sea below) in 1815 , has verged agsin towards unity in consequethce of the war the expulsion of the former from the Confideration leaving Prussia as the ruling power in Germany. Pending their final union under oue govt, the old states of the Confaderation (excluding Austria) wara ranged, provisionally, under two groups, as North Germuny, and South Germany. N. Germany, coneisting of 22 states, was under the absolute and ontire leadership of Prussan, while S. Germany, numbering 5 states, formed a lousely connected group uader the uscendency of Bararia. Tha two divisions wers bound together, to some extent, by treaties of dilince betweem Tussia and tha principal By these trunties the contracting powers mutually gy these trenties the contracting powers mutually and it was further stipulated that in cass of war, the king of Prussia was to have the supreme command of the joint armies. After the close of the Franco-ierman campaign of 1870 , the $\mathbf{N}$. German Confederation was diesoived as a pulitical organization, and the etates which compoded it, together with tha S. Germma pow ere, agoregated into ana antooony that of at emarged reinstation of the old German Emptre, The territory of the Garman antionality, prior to tha formation of the new German Empire, wis subdividad as followe

fendatories and of the representatives of the free cities. But as the diet had no indepeodent or peculiar force to carry its decistons into effect, they were very freyuently as attempt was mate to iutruluce a more regular system of almimstration, and a better policy into the eurpirs. As the political division of $G$, at this peried was independent of the territorial subudivions which the changes in familhes produced, it lasted as long as the empire itself preserved its unity ats a political bouy ; and even after the assmmption or independence by the kine previonaly, furm part of the king ana or still inclnded previously formeda parc of the cmpire wasstil included, By their refosil to join in this arrsnmement of internat policy, and to become amenable to the decrees of the Aulic Chamber (Reichs-Kqumergericht), the Swiss can tons finally severed the last tie which nuited them to the empire. The influence of the kings of Poland caused a similar separation between the empire and the lands belonging to the Teutonic order, on the right bank of the Vistuls. At the period of the outbreak of the French revolution, in $1789, G$. Was divided in IU citcles, each subdiviled into many States and territories, viz. - 1 .
The Circle of Austrit, belongiog entirely to the honse of Austria; 2. The Circle of Burgunily, also belongang to Austria; ; The Circle of Westphalia, divided anong clerical avd lay princes: i. The Circle of the Itilutinate $f$ the betwer Phine divided among a number of Circi torial prinees and nobles, the must jowerful of whon was the lanigrave of 11 esse-Cassel: 6. The Circle of Sualiu, numbering as the most powerful of it many petty sovereigns, the duke of Wïrtemherg, and the margrave of Buden ; 7. The Circle of Bavdria, in which the elector of Bavaria and the bishop of Salzburg touk
the leal; 8, The Gircle of Pranconia, comprising nasuy the leal; 8. The Circle of Pranconia, comprising nasin principalities, counties, lordships, and free citics; 9
The Circle of Lower Saxony, mcluding the duchies of Magdeburg, the two Becklenburgs, and othere, sud Magdeburg, the two sheckenbargs, and other, sith Bremen; 10. The fircle of Cpper Soxony, of which Prussin formed the most powerful constituent; the Sla vonic cotuntries, which were not included in any circle, wore the kinglom of Bohemia, the margraviate of Moravia, the duchy of Silesia, and the margraviates of Upper towns, not belonging to any circle, but held directly of the emperor. Every circle had its det, in which th clerical and secular princes, the prelates, the counts and barous, and the free imperial cities, formed 5 benche or collges. Affairs of general importance to the empir at large were treated by the imperian dict, haich the mperor hat the powed ; but which, since 1663 , was constantly assem pled at Ratisben. Ia 1759 , the members of the diet were as follows:-1. The college of electors: Mentz. Treves, Cologne, the Palatimate, Brandenburg, Saxony Bavaria (sioce 1623), nud Branswich-Lineburg (since 1092). 2. The college of the clerical and secular princes tithops, margraves, counts, \&c.; the mumbers of the clerical members being 36 , and of the seenlar tords, 63 3. The colleges of the free imperial cities, then 54 in number. 10 1791 began the memorable contest with revolutionary France, which ended in the overturn o the old Germanic constitution. The treaty of Campoormio, the first that history recoras in which the khin was acknowledged as the frontier of France, decreed a and this indemnification conld only be obtained by the pulintion of some others whose rights were equly in delensible, in the lathert of the empire itself. On Jan25, I $\times 03$, a decision was come to by the plenipetentiarie assemited for the arrangement of this matter, the in port of which was as follows:- The Holy Romon Empire, as that of $G$. was styled, remained as it was divided into circles, but which, with the total loss of the
Circle of Burgnody, und of the lands on the left bank Circle of Burgnndy, und of the lands on the left bank of the Chine, were reductd to 9 , whone houndiariss it was proposed to rozalato antw. Thid regulation his ceedell each other. The right to sit and vote in thodie rem-inell, as formerly attached to territories hold diectly as fiefs of tho empire; and the nlace of the couro ation of the diot remained at katishon. the college em-ined ulso 3 in number; the first being the collegg of electork, who were 10 in namber; one clericat, - the lector wreh-chan ellor: and 9 mecblar, - Buhemia Bavaria; Sixiny, Brandenburg, Bronswick-LAnelmar, Salzhurk, Wirtemberg, Baden, and Hease-Cansel. Thi chertorate of $\mathrm{M} \cdot \mathrm{n}$ tz hinf merged into that of tho arch hancellor, and the Pilatimate into the electorate of Bivaria: Treves athl Cologno hud disappeared, and of primees - counted I31 votes. The collecge of towne was compuacil of 6 witl votis: Ifamburg Lilluck, Bre men, Frank fort-out thu. 3k:in.  tire disselatinn. Thu tranty of Prealurge, in 1 N05, which oflowed the haffle of Austarlitz, gave him thin nutan of carrying this projuct into whel, by forming a consou7 pluced thonselves unider tho protictorate of the

French emperor. The wars which followed, with Prus-
sia in 1 s 15 , wad with Austria in 1809. gave Napuleun the power of altering the terzitorial distribution of $G$. at pleasure. He accordingly created for his brother Jer owe the new kimgdom or west phalia, and for his brother-a-law suachim Murat, the Graud-duchy of Berg, und supported bis canse to new dignities and an openly ro coguized independence as sovervigns. Uoder the cir cumstances, the emperor, Francis II., by a solemn act Aur 6,1809 . in title of eniperor of Cutrmany Aug, b, 1809. In the following year Napoleon invorpo aredire, sod divided them into departments; thes sep rating from G. a district peopled by wore than I, 100 , orr ohubitants. The termination of the war with Russin called in Germany the Liberution War, restored to its geographical and political position in Europe, bu not as an empire achnowledgiog one supreme head. A confeleration of 30 independent soveregros and $\downarrow$ fre cities replaced the elective monarchy, laist fell bude itsown decrepitude. In the choice of the smaller prinees who were to become rulers, as well as all thuse who wer obliged to descend to the ranks of subjects, more atten the was prid to kaily and porlichere the cal fiefs, und the greater part of the frue iouperind cities were incorporated into the States of the more puwerfil princes, upon the dissolution of the empire, und wero not re-established. Ooly 4 cities remained in the enjoy ment of their political rights. The signimis and ratitication of the Act of Confederation took place, after lon discussion, June $8, \mathbf{1 8 1 5}$. As thus settled by the treat of Vienna, G. Was divided into 39 sovereiga states, or portions of states; but the number became reduced to 34: 1. By the demise of the Saxun princedom of Giotha in 15 th, which became incorporated wing saxe-Coburg and saxe-xcimingen; 2 . By the falling awsy of th duchy of Anhalt-hothen, whinh, in 1847, became at the princes of Hobenzollera-1lechingen and Hobenzol the prisces of Holsenzothera-1hecor of their tinemen the king of Prussia, tead of the honse of Hohenzollern. sni 5. ## eriminat, $a$. Pertainiug to a germ.

by Jiquefation area, the circular or oval apace formed by liquefaction and metamorplosis of a peripheral portion of the germ-mass, preparatory to the applearauce
of the first trace of the proper embryo. It is divided into a ceutral clear part called orra pellucido, and peripheral part called arru opeca; the portion of the peripheral part called arra opuca; the portion of the called the area rasculusa.- $G$. membrane, the stratas of cells and nuclei of cells originally forming, and afterwart extending from, the germinal area. The external stratum is the errtbral lnyer, also called the serous and onmol layer; the internal stratum is the visceraf hayer alsu called the miucous and eagetal hayer-G. apot, the nuclens of the germinal vesicle. It evnsists of a finely granulated substance, strongly refracting the rays of first formed aod most essential part of the which is the surrounded by the yolk, and passes to the periphery of that part prior toimpregnation, after which the germinal vesicle licconaes opaque or disappears. It is sometimes called, affer its discoverur, the $P$ perlingian resicle
Ger'minal, $n$. [Fr, calcotlar.] The name given under the breuch Republic to the seveuth month of the year, dating from sept. 22, 1792. It commenced March 21 and ended A pril 19
der'minant. a. [Lst. germinans, from germinare, to
sprout.] sprouting; budding.
Ger'mimate, v. $n$. [See Supra.] To shoot; to begin
to vegetate or frow, hs seeds. to vegetate or grow, us seeds.
Gerinimation, $n$. [lat. germinatie, from germinare to put forth, to bud.] (Bot.) Tho process by which a pare best olserved in dicutyledonous seeds, such, fur instence, as the besn, per, lupin, \&c. These sceds consist of two lobee or cotyledons, enveloped in a common membrane; when this is removed, a emall projecting body is ecen, which is that part of the grrm which efterwards becomes the rout, and is termed the radicle. The other portiou of the germ is seen on caremily separatiog the cotyledons, snd is termed the plumule ; it afterwarde formo the stemand leaves. When the ripe sced is remover frun the parent plant it gradually dries, sod may be any change; but if placeal ander circumetances favors ble to its $G$, it scon bergins to crow. these requisite cir cumstances are a due temperature, muisture, and the presence of air. Where these are present, the sced gradually swells, its membranee burst, and the gerni expands. The root is st first most rupilly developed, the naterials for its growth heing derived from the cotyledons; and when it shoots unt its filies or rootlete, these adsort nourishment frum the soil, and the plamols is developed, risiag npward in a contrary direction to the root, and expanding into stem and leaves. For
this growth the presence of air is reguieite; if it bo carefully excluded, though there may be hent and moist urs, yet the seed will not vegetate. Hence it is that aeeds huried very deep in the carth, or in a stiff clay, remain inert, lut on admission of air by torning up the soil, begin to shoot forth. From experiments which have been maile upon the G. of seeds in coufined atmospheres, it appears that carbonic acid is evol vel, und that jart of the starch of the cotyledons passes into gnmand ougar; so that most seeds, is we see in the convarsion of laarley into malt, become sweet during G. Light is injurious to the growth of a seed. It is, thenefore, obvious that the different requisites for G. nre aftained by phaciug a secd mater the ourface of the soil warnued hyy
the sun's rays, where it is mointenel by its humidity and by uccasional showers, and exclantel frum light, but within reach of the access of nir. The most favornhle temperature is between $60^{\circ}$ and $\mathrm{A} 0^{\circ}$; at the freezing point none of the more profect seeds vegrtute: and at temporatures alove 1000 the young germ is usnally injored. Certain chemical chasuges, the most important being the comversion of starel into sugar, take place in the seet, and the embryo is nuurished by the product of theso changes. Thus nourishet, it incrivans gradunhents of the sued. Its hower extremify, or tailicte, in minents of the satet. Its hawer extremify, or dawneard direction, becomes fixed in the soil. The oppessite ex tremity soon ciongates upwards, Hind forminated aiove hut, or browing perx of the stems. and at the same time the cotylelonary purtion ix cittior lefo ander-ground, ar is carried upwards to the surface. huring the kralual thevelopment, tho embryo continnes tolve nemriahed from the mattera contained in the allomen or entyledonary portion, and is ultimately enabled to prombee len first leaver and rout. The yung plant in then in romation to acquire the necesany momishiment hy itandf, fir it further muppurt ath krowth, from the muatia hy which it is surrounded; and leing reurered independent of the nowd, has n ) need of the cotyledomary jortion, which
 surfince: thin moile of $G$, is termed leterorhiset. In the G. of monorotyledonous wmliryon, then rulicle in not itgiresof branches of pendy an as to form the root, lint it

Gild'ed, $p, a$. Overlaid with leaf or a this cuating of Gildier, $n$. Une whose trade or profession is to overlay thanes with gold.
Ciltiling, $a$. (Arts and Munuf) The art of applying a than couting of gold to the surface of bodies loy either chemieal or mechanical meatas. The beaty and dura-
bulity of gold reuder it the must valuable of all the metals for ormameut. Its great malleability enatles un sman! quantity of it by mechanical means; and liy the aid of chemical agents it can le still aute minately be filded. The promess of water-gideing is pot wuw much used. By this meane, sitver, after being perfectly cleaued, is gilded by rubling it over with a sulation of cold in thercury. or amalgom nf gold. Tho article is then
heated over a clear charcoal fire, by which the wercury is driven off and the gold left adberiug to the surlace. Cupper attil brass are gilded by this process, ly cleaning
and rablug the surface with nitrate of meatury and ralbing the sarface with nitrate of mercury, by which it is anmatgameted and enabled to retata thee gold burninhel. The fupes of mercury driven off in the heating reuders thas mode of gilding very unhealtay. It cananot, of conses, he used for gilding metals that do not furm an amalgam with mercnry. Buttugs nod soda. kinds of jewelry are pilded by it: the quantity of gold ruquiral being so small that a gross of buttuns 1 inch in dimeter may ve gilled on both sides with 5 grains. Hetals may be gitied by immersing them 2n a somution deposits the gold in its place. One of these solutions is made by dissolving 4 oz. troy of gold in 21 a ozs, aqua
regia, heating this until the redalish rapory cease to be evolved, diluting with $11 / 2$ pts. of distilled water, whling The article is dipped in the hot solution and agitated in The article is dipped in the mot shmbions and agitated in it for abont a minate. if golabe dissontred in a kol ation mixtore of chloride of gold and nierate of gold with blackens it, but on the: application of heat becomes rich gilding: If 5 drachms of gold the dissolved in 10 oz . of aqui rogiz, with 1 drachm of copper, a od eleas liweo the unhes will contain finely divided gold: which may We applied to copper. brase. and silver, by rubthing it

gyrdan, to surronad, to eacircle.] To bind by shrroundiog with any flexible substaoce, as with a twig, a cord, or a bandage of cloth; as, to gird on a eword, to gird un warlike harness.
-To ourronad; to encircle; to enclose; to encompase.
" His easy stepa gurded with ecaky wiles." - Nutom.
-To put on ; to invest; to clothe; to habit.
-[A. S. gyrd, a rod.] To jibe; to reproach severely lash; to vituperate.

Being moved, he will not apare to gird the god." - Shake. ter severe earcusms.

## $-n$. A twiteh or pang

The checks and gryds of consciance." - Goodman.

- A sneer ; a surcaem ; a gibe.

Gilrd'er, n. [From A. S. gyrdan, to biad.] (Arch. and Chv, Eng.) A name given to long beanas of wood aud iron, that are throwo across upeniogs of considerable
span, to support floors aod the roadway of bradisea. $i f$, are of two kinds, simple and framed; the former being merely woodeo leame, or beams of enst or wrooglit-iroo; whale the latter are beams of the above onterials made of eeveral pieces, put together in such a manaer that they nay be capable of offering a greator reostance to excedsive pressure thata is simple $G$. could exert. The depth ond width of at $G$. must be proportioned the the great they may be able to offer the greatest possible ric that they hay be able to ofter the greatest possible ric
eistance to ita pressure, with the lesat pussible quantity eistance tu ita pressure, with the lewat jussible quantity
of material. 'The stvength of a $G$. is angmeated by addof material. to its depth rather than ite width, hs its capability of resistance increnses directly as the width and as the aquare of its depth. If, for example, a benm that is 3 inches wide and $U$ inches deep will bear a cortain woight, a bram that is twice as wide will bear twice that weight;
while one that is twice as decp will bear four times as while one that is twice as decp will bear four times as
much, and one that io twice as wide and twice as deep, much, and one that is twice as wide and twice as deed,
eight times as much. The longer it is the greater will eight times as much. The loxibility; or in other words, if two beame of the same the other be suppurted the ends huving logail we the other, bo supported at the ends having equan weights eutependod from their centres, the louger beam shorter one, - tho capability of resistance in $\theta$. of sll kinds being inversely as tho length. Tho manner in which the weight is thrown on a besm has consiterable influence ons its power of rexistince. Thus a besim will nut bear hulf as much, if all the weight be collested it ite centre, as it will if the weight he distribated equally alonk its length. Beams will also bear a greater weight
when tigeir extrenuities are eccured or loved with whon their extremities are eccared or tomaded with
weingt of masonry, as in the caec of $G$. stretching from weight of masonry, as in the cuee of $G$. stretching $A$ from
wull to wall of a buildins, to support a floor. $A$ dead Wull to wall of a building, to support a noor. A de
bniform wcight is less injorions to the puwer of r eistance that a $G$. can exurt, than a weight which is in motion; but it is found that the parwer of resisanace of a hean lometel with a lend weikh dor fonk pariod of timo. The amount of woight that should be thrown on a 6. undur any circmmatatuces ahould nevor exceed onethirid the welkht that wond have to be uppliced in order to bronk it. f: ehonde alas bo whaped in accordinece with the conditions under which they aro to he houded.
Thus the upprer nneface of a $g$ aupuortid nt hoth ends,

 be elliptic, the under surface leing perfectly otrajght in
 thanges or projecting edges of rietal at the top nod iot
 secthaget, as the jemer of chet-iron to rewint comprosp sing is atont nix times an great ma fra powor to resiat a
drawing atrain ; liot in wrought-iron $G$., on the controry,

 1018
wrought-iron to resist compression ie ouly half ae mmeh as itn power to resist teusion. In other points, the strength of iron $G$. varies in proportion to their depth
(iirul'er, $n$. One who girds : a satiriat in sarcastic person (xirding. 7. A coveriog; a biodiog or surrounding Gir'dle, $n$. [A. S. gyrdel, from gyrdon, to surraund Ger. gütel.] A baud or bels; soumething tied around the loios. It was מiore or less in conmon use adiong ser eral of the nations of adtiquity. In Scripture, the gird agg up of the loins is frequently alladed to ae being practised by the Jews lietore undertaking a juurocy G. of sackicloth were also sumetimes wurn ae tokens of humiliation. Amoog the Greeks and lonans the $G$ was a military oroanient; and hence to deprive a eoldier of the Romene was aiso fasteped by a $G$. or belt thout the waist, and it was reearded as rery effuminate to ap pear abroad with the tunic clackly or carelessly girded. pear abroad with the tanic elackly or carelessly girded. and ungirt, idleness, effeminacy. The young womed Always wore a girdle, or zone, before marriage; and heuce the parase "Zomam soitere rirgineam was ocme times used to denote that ceremooy. The G. worn by Venos wha called "cestus." Among the Romans the $G$ served also as a parse; and io Engladd it was formerly the practice for bankrupte, or iosulveats, to give up their $G$. in open coart.

Ha'cial Drift, $n$. (Grol.) Sprend over much of the N portions of Enrope and America, are found remarkable acemmulations of clays, sands, mad gravels, sumetimes stratified, sometimes piled rudely together, nad contanning large and small blocks of stunes, which also occur loasely scattered over the bare rock surface. The solid or polished, as it the overlayiog material hadheendragged or dritted along over it. Sometimes the deposits are in detidito lines ; and sometimes the heaps have definite formas. These deposits and effects are evidently the result of the action of glaciers and iculergs, and the formations are known by varions names, as "Boulder Clay," "Erratic Block Group," "Diluvinm," "Drift," \&c. (Sce Icebero, Glactes.) The action of glaciers in producing
drift is easily noderstoul. The stones, sand, and other Irift is easily noderstoonl. The stones, sand, and other material arising from the disintegration of rocks on mountain sides fall into the valleys, and are distributed broxren the mas of the weight afthe whole muwing mnes grind nipin the grunnd and rocks below, thus adding to the qoantity of material moved, and leaving the ruchis striated and polished. Wher, the glacier melte, these accunalations are depesited or carriml by the strenas. Should the entire glacier molt hwny, the delvis would remain as drift. When the glacier reaches the sea-coast, and advancing into the water breaks off as an iccberg, tho liroken portion day bear with it an immense mass of broken rock and mod. As the glacier is drifted away by currents to Warmer intituder, the mass of ruks, hand, se., will fee gradually depmsited on the sea bottom as the zlacier
melts, or left on the shoals and hiphrr rocks where the glacier might strand. Thus may have heen produced the variousplienomena of $G$. $D$. They are often complicated in nature by snlisequent elevations aon denndations. In America the drift extends from the pelar recions to alit the 40th deg. of N. Lat. In the valleys of the Delaware, Su*quehanna, and the Missinsipli, it extends further southward. In Europe it is nut finnd in the countrics burlering on the Melit-rranean. In vertical range, the Hrift in Arwerica cosers all the monntain peake E, of the
Rocky Jlountaing, except suveral Lundreal feet of the Rocky Jountains, execpt si

Seaves them poied on the top of a column of ice. For effects of glaciers, see Glaclal Draft. The smoothed, rounded, ind striated ruck infacts, gravel deppoits, dc., are glacial phenomena that indicate a time not distant, geolugically speaking, wheo a large part of the temperate region of the northern hemisphere was sub ject to glaci,d action. Glaciers exist among the lima-
laya Momntinus on a granil scale, and in high Arctic lati-tnd-os, where the smow-line comes down to the sea-level they form appareotly deep, unbroken seas of ice, extend iog over vast tracts of country, sloping towards the coast. At the shore, large masses are constinntly being detached and floated a way as icebergs. (See Iczerkgs. coast of Greenland, is about 45 m , wide where it reaches the sea. The structure and motion of glaciers have been
elahorately investigated by Rendu, Agussiz, Forbes, aod elaborately investigated by Renda, Agassiz, Forbes, aod Tyndall.
Glacieres, (glas'yäres, n., pl. [Fr.] (Geol.) Cavee full of ice. They are found chielly in the Alpine mountaine, and are unconnected withany glacial syatem. They are found when the mean temperature of the enrface of
the earth is above the freezing point, and nre from 50 to 200 feet below the aurfice. They thas furnish exceptiuns to the rule that the tomperature increases from the surface toward the centre of the earth
Cila'eis, n. [Fr. from L. Latt. glatia, possibly from Ger g/att, smooth, or froms lat glacies, ice, from its amoothness.) A place rendered slippery by wet falling on it, aud being frozen over. - An casy, insensible alope. (Fort.) The inclined plase or slope that extends from the exterior of the covered way towards the open country (see Fig. 749). The crest of the glacis is about seven or eigbt fect above the terroplcin of the covered way, rounding the fortifications. The slope itec-1f exteuds rounding the fortifcations, 150 feet from the covered way, having in inclination of one font in twenty, or thereabonte, from the crest of the work to the natural surface of the ground. The glacis covers the masonry or rivetments of that part of the rampart which forms the scarp of the
ditch, and sorves to bide it from the batteries of the enemy. It also concealosotliers who are in the covered way from the view of the investing force, and protecta theon from their fire. A banguette is nsuadly constructed in the covered way at the foot of the futerior of the glacis, which emales the besieged to pour a fire of musketry from theuce on any patrty engaged it the con-
struction of field-works and upproaches, or advanciug to the aseault of the fortrees.

 muticmont of tho ioptlacs. Tho tirst uppearance of
the gladiatorial games (munus gladiatorias) in Rome. Whe B. c. thb5. They soun became so pophiar, that in the imperial tiones they had becone oue of the favorite agusensents of the peuple, and were laviehly bestowed upun them by such ediles, prators, consuls, aud emlerorb, as wished to gain, or to retaid the havor of the
pupalaie. B. c. 183 , et the faucral of Quituctios Varro 120 gladiators fought to the death, aud Auguatus de
creed that this number shonld never be exceeded; but before his time even still greater unobers lud appeared upont the arena and the number of combatauts was greatly increased under the emperors Caligulit, Claudius. Nero, Trajan, Adriad, uid Cumbiodus, the laet of whom appeared bionself in the character of $6 i$. in the erena. Ender Trajam, gladiatoial hights end combats of wild animale, (the latter often conjunied with the former,) werc kept mp for 123 days, during which time 11,000 heasts were slath, and orar $10,000 \mathrm{G}$. Fought. In ancicot timus, the Foruas uas the noual place for such inumedintely in frunt of the funal pro were fonght inmeduce called Bustuar it. In later diye, amyphitheatres were erected. The $G$ 's were origmally slaves, for the most part captives in war. They were maintained and drilled in bands (familize) at Nome and other citice, particularly at Capmanand Ravenna, in special establishments (ludi gladiatorii), under the charge of overseers (lanistie), some of whom made it a prontable busidere by the bire or eate of $G .8$, and wthere stood at the eanic tione in the pay of wealthy praticiana, to whous the possession of large numbers of G.\& was sowething more than a natter of mere abusemmat. Thus Clodius and Milo carriwd on their contest through G.8. Casar it Fompey was first obliged to defend himself, at the ontbreak of the ciril war. Though the is were at fres only armed with swords, yet in later datys, many ditlererent kinds of them were distinguished accurding to their mode of fighting, armor, dc. The mirmallo wats armed with a brickler and a short sword, and bore on his casque the figure of the fish mirmillo, whence his name; -the retiarius, who fought against him, had a trident in the right hand, and in the other a net, with which he etrove to entingle the head of his opyonent; - the essedarius, who funght from a chatiot (essectum); - the awlabates, or equester wo romght on horseback, - the wers announced in ailvance beast, wc. The games telli), and naually began with blunted weapous, but weth the excitemutut of the maltitule, these ware thrown aside, and the $G$. fought for life. When in $G$, wats $8 i$ verely wownded, he threw down his arms and remaiaed at the mercy of the comqueror, who killed him unless the spectature opposed it; if they raised their hatids, turning the thumb dowawards, it was a sign that they wished his life spared; lut it they raised the thumb, he was shan. The arrival of the emperor was also a sigmal of mercy to the vanquished. Attur 3 yeard of nervice, the gladnators were allowed to retire from the arona, in
tuken of which disclarre, they were presented with a tuken of which discharge, they were jresented with a
wooden foil (rudis) and a palu of silver. These cruel wooden foil (rudis) and a palim of silerer a continuance of over 600 years, were iuter6porto, after a contmuance of over 600 years, wrere inter not fitally abolished uotil the time of Houorins, A. D. 402 . The ancients have lett us sundry beantiful otatises of gladiators, the two most celebrated of which aro the Borghese Gludiator, and the Dying Gludrator, both it

The quantity of liquor that a glass vessel contains; as a glass of water
(Chem.) The sulustance known as glass is, when chem ically considered, a very vanable componad. The different qualities, bowever, agree in one particular; they
belong to the class called ausoluble salts, and have sil belong to the class called iusolnble salte, and have sil
one acid io common, namely silicic scid. This last substance, usually simply called silex, is found io nature in the forra of quartz, either crystallized or amorphous, as flint and as fiae sand. Io the last form it is Daturally derived from the disintegration of granite and other rocks containing quarty, in which, by atmospheric influences and the prolonged solvent and mechanical ac
tion of water, the other ingredients have been washed away, and the more indestructible quartz particles are lett behind. This quartz possesses all the chemical properties of an acid. It combines, like all other acids, oxide of lead, and of all other metals, mat forms a seried of substances which, accordiog to the adopted nomencomponnds of salphicates, in the same mamer as the bases ure called sulphates and titrates. As all compounds of this class are called salts, the silicates are, when cheruically considered, ss well salts as the sulphates. The distinction is of a plysical and not of a chemical nature; the silicic acid, heing liquefiable not by Fater but by heat, comanooicates this yuality to all its salts with a few exceptions; and its compounds are therefore, as a rule, us insuluble as the nitrates are sul uble. There are two otheracids, boracic and phosphoric,
which also form a large number of insolnble saits called horates and phusphates; and the claemist sarefore horates snd phosphates; and the chemist therefore re-
cognizps also s horax or a phosplane glass ; but in common langunge, the name of ginss is exclusively applied mon langunge, the name of glass is exclusively ajplied
to the silhcates. G. made with quartz and soda alone is of a brilliant lustre, und easily fusible; but it has a blaish-green tint, and does not completely resist the action of san and rain, which, in the conrse of time, tarnished its brillisot, smouth surface. $G$. made with quartz nond lime alote is much harder, ont so easily finsible, and perfectly colorless; it resists the action of sun and raid
better. The combination of the two has heau found by better. The combination of the two has besu found by experin-nce to possess great advatitages over either of
thom ahue, excupt tor special purposes. Potash is usually mulded to promote the fusibility and colorless transparconcy of the compound, as the silicate of potash is still more fusible than that of soda, and is perfectly colorless. However, as it does not pussess the brilliancy or lnstre of the sonla-glaws, the quantity added must not be too large, as in that case the beauty of the prodnct is impaired. Common window- $G$. is comprosed of silica
6y parts, soda 13 parta, lime 13 parts, with a little alu64 parts, soda 13 parto, lime 13 parts, with a little alu-
mina. Plute- . contains it parte silics, 12 parts soda, mina. Plute-G. contains it pirts silics, 12 parts soda,
5.5 parts lime, and 5.5 parts potash. Crown-G., for op5.5 parts lime, and 5.5 parts potash. Crown-G., for op-
tical purposes, han no soda, as that imparts to it a greenish tinge, hut contains 62 parts sflica, 12.5 of lime, hand 22 of potash. Pint. G. is a doulse silicate of potash and oxide ide of lead 33.28 parts. The uxide of lead increases its, fusibility, renders it wofter, and greatly increases its beanty and lustre. Barytaiucreases its fusibility, and oxide of zinc also increasss its lrilliancy and refracting power. Buracic acid is also sonetimes substituted fur a portion of the silicic acid. Flint-G. is ased for ornamental and table pnrposes, and is optical instruments. The celchrated Bohemian G., so nupch valned in the laboratory
for its hardness aud infusibility, containe the silicate of for its hardness and infusibility, contains the silicate of potash and lime in predominant proportions. The more fusible Boliemaan G., which is used for ornamental pur-
poses, contains, in addation, a notable quantity of siliposes, contains, in addation, a notable quantity of sili-
cate of alumita. Buttle- $G$. is a cheaper and commoner kind, beink mostly conposed of silicate of lime, ant containing oxide of iron, which gaves it its dark color, Some varieties of $G$., emulsedded in sand and heated nearly th the point of fusion, and then allowed to cool slowly, become convertel into what is called Heaumur's porcetain. It is hard, white, opuque, and somewhat less fusible. The change is due to the crystalization of its silicates, and is known as devitrification. Fnsion reficture of imitation cems contrins a large quantity of oside of lead, and otten the borate of leas. It is called struss or paste, and is very soft, easily fused, ond highly of clay, which must be tree from iron or lime. They of clay, which must be free from iron or lime. They
are of two kinds, open like ordinary crucihles, insed for common $G$, and closed ut the top with nu apertare in the side for thit-G. The pots are jlaced in a furnace, several on the same platform, and vach othe opposite a saall archet opening in the side of thu furnuce, thrugh which the workmas tills null empties it. They are now Elled with the prepured materiain, called fril, mixed with a proportion of hrukn'n glass called culleb, of the

Fig. 1164. - egyptian glass-blowehe.
trirling is flattened into a disc of uniform thickness. This is called Crown-G. The other is to blow o long cylinder of uniform diameter, which is thea trimmed at and opened on a table into a flat sheet. Bottles, \&c having irregular shapes and oroamental figures, letters Ec, are introduced while suft into moulds, and expanded
by blowing. All $G$. requires to be carefully anoealed by blowing. All $G$. requires to be carefully annealed otherwise it is liable to fly to pieces upoo the slightest touch of any substance hard enough to scratch its surlace. When mested hottle-G. Is dropped ioto water so the small end is liruken of they crumble into a tine powder. I'his probsbly arises from the unequal a of the layers caused by the sudden cooling of the out oide, while the inside of the mass is still bot. They furm the well-known phtlosophical toy called Prince Kupert's drops. Many attempts have been made, and time spent
in efforts to discover $a$ mall-able $G$. M. de la Bastie (1876) claims to have discovered a method of rendering glass duralle, which he terms rerre trempf, or temperet and oils. It is saill that in the reign of Tiberins a flexible and oils. It is said that in the reign of Tiberins a flexible
$G$. vase was exhinited, which on fiejng bent could te restored to shape with a hammer, and that the emperor caused the inventor to he put to denth or bamished.
G. Etching on. The art of prodncing designs upon glass, by the currosive power of hydro-flyoric acid. Io order to effect this operation, the glann is concred wion it with the veedle, as io etchang upon coppor. Snt phuric acil is afterwards poured on, and finor spar or fluoric acid sprinkled on it. The hydro-fluoric acid, which is disengaged, acts powerfully ppon the exprosed portion of the glass, while fumes of fluo-sihcic acid are
fiferated. After four or five hoars the acid is removed inferated. After four or five hoars the acid is removed,
and the bees-wax removed from the glass with oil of turpentine. The glats is then found to be etched with thu design required. The operation may be reversed lyy drawing the desigo upon the glass with a mixture of beer-wax aod turpentines and then subjecting it to the action of hydro-floric acid.
(Hist.) Nothing is known, with certainty, concerning the invention of glass, which dates from the earliest antiguity. The oldest specimens are Egyptian, nad we porseas specimens of opaque glass beariay the name of the queen ilatasu of the 1Sth dynasty, 1445 n . c. Transparcnt glass does not appear enriier io Egypt thmn the 2th dyonsty, about 750 n . c., when loottles were made of it. Uader the llarabhs, Egyptian glass seems to
have been extensively expurted to Grecce and Italy, and have been extensively exported to Grecce and Italy, and
its reputation still contnoed under the P'olemies, when the farnaces of Alexandria produced glaes vases of numberleas shapes and cousiderablesize. Egypt still retained the preeminence in the manufacture of $G$. nnder the komans, the sand of Alexandria being indixpntathle for the fitsest pualities; and it may loe said that the art has never been extinct in that comntry, the Fationite Calijsho having issued glass coios in the 10th und 21 th centnries, and leatutiful lumps of ghass, entuwilled on the surface with varions colors, having been made in the 1 th cent. Atter the Frgyptians, the people of autiquity most rehowned for glass were the Thonichans, who were the
logendary invontors. Certain of their merchants, it is Natid, veturning in a ship laden with matron or soik, stad nandy twor cow wher pots all lumps of intron on the sumed, whith, fused liy bots onl lumps of mintron on the sand, which, fusced by
(hes liest of the firs, formed the first glans. Sidun, insheed, was long celclarated for her ghass-wiares male of the sand bronght down from Monnt Carmel to tho month of the river Bethes. Althemgh Josephas claims the invention of the urt for the Jews, nu relmans of Jewish $Q$. are known, and it is probable that the dews were princlpally indebteil fur their nugplies to the nejghburing

 fartute. The ghos-making art in laly than nut slatu

of Titns, being glazed with talc. and seme dontit remain$\log$ as to the use of glase for this purjese at Pompeil Lactantius, in the 3 if cent. A. D., and St. Jeronte, +22 A. $\mathrm{D}_{3}$ mention plass viodows. Under the Rumians, colored as well as white glass wis extebsively used. Minkt of tha preciousstones weresaccessfolly imitated in glass pastes, vaseg, of which one of the most culehrated is the Port vases, of which one of
land vase (Fig. 1165) in the Brit. Mnseum, atront 10 inches high, of transparent dark

 geography and astronomy, on which the lutist importat conntries, mountains, towne, rivers, de., are represented, thets calfed a terrestrid flobe, - or the most importan bars and constemations, as well wh the imagianry cir cles of the heavens, then called a celistial globe. In either case it is used for the purpose of presenting more
vivadly to the mind tho varions nctual or spparent covoments of the carth and of the beacenly bodies, and assints materially in obtaining a knowledge of the tars. Ptolemy hud a terrestrial gholu, as uperars from the Almagrstus. The ancients were also acquainted with the nace of the celestial glober and it in certain that Archimedes possessed a planetarinm. The two oldert gloties that have come downt to us are of Aralic origin. Ono of 1223 is preserved is the museum of Curdinal Borgia at Iellotri, and the other io the mathematics sulonn at Dresdon. In the 16 his century, Regiomontanne Apians, Mercator, and others paid grent attention to of the ancient elolot are themen blued of the anctent glohes are thuse buade by Blaew at AnThe latter propared, in 1683 , for Iouis XIV, a pair of lohes, celestial and terrestrial of 1\% feet in pair The most famone article of the kind is the Gottor globe, which Duke Frelerick of Holetein had made nat set up at Guittorp, 16is6-64, hy Olearius aud Busch, of limburg. It has heen at St. Petersburg since 1713. It is of sheet-copper, atud the stars are represented liy litthe perforations. Now-s-days these large and costly glohe, are less rsteemed than the smaller and more conveoieo ooes, by meabs of which the samo eod may be attained.

Aboat 1725, Andreä and Homan commenced at NuremAborg the manufacture of small celestial nud terrestral globes, the use of which suon becane extetsive is Germany. The most celelbrated globes of later days are thuse of Lalande and Messier, 1783 -80, manofactured
af Paris, and the celestial glotues of Rhode, of Berlin. the latter being especially commendable for their accuracy and finish. Yery useful globes of different sizes, aloo relier-glubes, are made at Leipzig, Weimar, Bertin, and Vienna. A peculiar and colossal sort of terrestrial globe is the georama, a hollow klobe, formished with sulleri-s, whence une sees the various countrics, moun-
tains, rivers, \&c, reversed, as it were. Wyldehas manyfactured such a globe on the scale of 1 in to 10 kng m Geng., Pop.-A According to Petcrman's Gemgraphnsche Mitheitungen. the population of the glohe, is $1850, w$ estimated at $1,+39,145,200$, of which, $312,398, t^{4} 0$ are 8 8donn to Europe, A31,000,000 to Asia, $200,219,560$ to Anvica $t,+11,340$ to Australia, and $86,116,100$ to America.

Glove, (glue.) [Sax. glop.] is a covering for which is divide into compartments for each separate
hanger. Xenophon asserts that tho Persians used glove hunger. Xenophon asserts that the Persians used gloves
in cold weather, and makes a charge against them on that account, for their luxurious habits. They were in and in the Dilative Ages they were decorated with gold dress of kings, nobles, and prelates. In the days of chivalry, it was the custom for the knights t., weser the glove of a lily in their helmet, nod that gift from the
fair sex was esteeused a great faitor, the knight's success in aria being considered as owing to the virtue of the
lily. Throwing town the glove, or gantlet, was like lady. Throwing town the glove, or gantlet, was like
wist esteemed a challenge to single combat amongst our ancestors, and he who took up the glove this cast down wis deemed to have accepted the w, niger of battle made at the present day are dos-skin, does, buck- limbskin, kit, and various other kinda of leather; besides silk, cotton, wool, and admixtures of the same. Particuwhich they are matulifictured, howler, than froth the substances of which they are composed; as Berlin. Would-
stock. Limerick, and Kundal. Kid gloves are the most used, and obtain the highest price in market : the best of these are the French make, aud hardly any of English or German manufacture caa come up to them in print of elasticity and general excellence. Sheepskin g gloves are usually of a white color, and are greatly used in the
army. Doeskin gloved are of a soft leather; and Woodarmy. Doeskin gloves are of a soft leather; and when
stock are a coarser variety of these. The process of glove-making is very simple: and, since the introduction of machinery into the trade, admits of ats
complicity of manufacture. The dressed skius are first cut out by cutring-machines, ant the fingers and thumb pieces are likewise separately cut. These disjointed particles of the glove are given into the hands of the sewers, who work it up into the desired form. The s. were
use a clasp or clam, which is held between the feet and use a clasp or clam, which is held between the feet and
knees, and clasps the leather white being sewn. French Knees, and clasps the leather while bengescwn. Framed
gloves are imported into England at a rate of above 4,000,000 pairs per aurum. Embroidered gloves are made in saxony to a great extent. The chief branch
of the manufacture carried on in the E . Sates is that of buckskin gloves, a kind of glove more peculiarly business is at Gloversville, N. Y. Kid gloves are pow made to some extent there and in New York city. In
the year 1881 , this country imported 9 i 11, it dene y pairs of kid and other skits or leather gloves, valued at $\$ 3,633,454$.

(itont'-wneliv'r, $n$ (Znöl.) A fimuly uf hirdk, capri
 fied upen inwets which they capture, whife yphe the Wing. The whipporwill (faprimatgus tmeifrens), wes withont the whag, and has then lirintlen of the lifl

nally etreaked with black. Ite ates are three, sad hava and bence its name. It begios its kong soun-poor-will, set, aodcontioues till late at aight; then remainssileot till near the dawd, whea it resumies and contimurs till suaribe. During the day the whippoorwill eleeps apon the ground, or on fallen tranks of trees, or on low rranches, and may ofteo be apprusched to within a tcw ret before it flines. It is Full that it always zits kith its body parallel to the brunch on which it alights, plliptical moch roanded and pearly equal so both enls; the color greenishi-wlite, byotid, eqnal at both with bluikh-gray and light-hrowo. These sre laid May, on the hare gromend or on dry leaves, and in the most secluded parts of the thickets. The Clank-will'swilow (Caprimulgua Carolinensix), of the Atlsntic shd Gulf States, much resembles the preceding, lut the bristles of its bill are turazobed with hateral filamedte, and the top of the head is reddish-brown, etronked with black, and the terminal two-thirds of the tail, except the four ceotral feathers, rufous-white. The (huck-will'sWiduw, whose outes scem exactly to arliculate these words, commences its singular call gencrally in the
evenong, son stter sunsct, ald continges it, with alurt evemag, ston stter sunsct. Ald continees it, with short
occasional interroptions. for several honrs. Tlis note or call, inetantly attracts the sttention of a sinameer and is strikingly different fram that of the whippoor will. Ia sound and articulation it seems planing to ex press the words ubich have been mpplied to it (eyuckwall s-widow), proouncing each syllable leienrely and distinetly, puttiog the principal emphasis on the last word. In a otill eveniag it may be heard nt the diatance of Dearly a mite, the tones of its voice bring strunger and more full than those of the whappoorflight of this bird is low, skimming about at is few feet abose the surface of the gruynd frequcnt it settling fee old logs, or on the feaces, und from thence sweep on sround, in pursnit of varions winged insects sheeping the night. Like the whipporwill, it prefers the declivities of elens and ether deeply shaded places, muking the surrounding dountains ritg with echoes the wholo evening. The Clithek-will's-widuw laye its egge, two io nomiter, on the grouad, in the woods: they are of a dull olive color, sprinkied with darker opecke, ath alwat as large as n pigeons. Another interesting Amorican rye cies, the Night-Hawk, will bo seen uader its proper

Gold, n. [A. S., Ger., Frie. gold; Dut. goud ; Danish gutd, from A. S. gelew, yellow. Root Ar. gla, to be clear bright, to shise.] (Mh.) This metal has been kuww from the remotest times. It is the Sol, or 6 m, of the alchomists, who represented it by the circle $\Theta_{\text {, }}$ the emsblem of perfection. It occurs in nature in a metallic state, alloyed wath silver in all proportions np to is pee dium, rod rodinm It is sometimes funnd crystallized the primury form being the cube without cleavar. also n frains thin scales or lamina, and masses popularly called muggete. The color of native $f ;$. is yellow of varius shadex, numetimes inclioed to silver-white, accordin o the amount of silver preseat. It is very dactile and malleable; its sp. gr. varies with the alloy from 12-14.5. Pliny states that when the propertion of silver in the $G$ is $\frac{1}{3}$ it is called electrum. This is the Greek word for amber, and the alloy may have been 60 called from its palo-yellow color. Palladium $\mathbb{F}$., called aloo porpezite from Porpez in Brazil, contains from 6 to 10 jer cent of palladium, nud some silver. Rhodium $G$. containe from $34+3$ per cent. of rhodinm. Iridiam is also found in connection with $G$. The G. of Califormia yieldix on an average so-thonsanadis of the phre metat; that of by inexperienced jersons, often mistakelu fur $\dot{\xi}$. Pyrite by inexperienced perse, ofen mistaken lor $\alpha$. Pyrites strongly, sive off sulphur, while $f$. may be cut in stices and flattened under the hammer, and will melt without any odur of silphor. The pyrites may, however, coll tain some $G$; ; in which case thry shonlif he roasted, powdered, and dissolved ju aqna regia with the nid of heat The solntion shonid be carchally bentralized with carbonate of emba, filtered, and a solution of protusulphat of iron adhed as long as there is a precipitate. The pre cipitate is hiltered and washed in nitric ucid, and the romainang lasuluble matfer is tho gold. Scales of mica for gold. G is found with comparatively small excelp tions in tho veins of quartz that intersect mutamorphic rock re. It is always very irregularly distributed, perer in contimous pure lunds of metal like many metallic ores. It occurs in the quartz in otringa, scales, plated, nnd in musses which are sumetimes an agklomerntion of crystals. The scales are often invisible to the naked eye, and quartz that mpears to constain no gold ofleu
yiclds a conaiderathle perceutage to the nsanyer. While yields a considerable perceutisge to the nsanyer. While the native place of cold seeme to be in the quartz rock the $G$. of the workd in minetly gathered, not directly from t, but fonn the efore aurifcrons veius. such deposits arenflen called allurial woshings and in Culifornis placer diggings, nud bave been derived from the dixintegration of wearimg dow a of the rock containing $G$. The $G$, of these alluvtul depasits is asinally in flattened siculco, or graius of difficrent dugrece of finemens, the size depeniling partly on the original condition in the rock, nitu partly on the dintanco it has been transported. The eobssor particles and nuggeta, roquirimg rapid currents to trunport thems, ero Iruped lirst, and ure gorn-rully found in cavition it the rowhy nhopes or turtonm of talleya, or a phace where tio Wisters naty have edilimid. vague tradition, unsulstantinted by reliable evidenc that apes of creat size were to be seen on the west cuast
of Afrika it was mot, however, till isti that the gorilla alsolntely became knows to naturalists. A skull of one of these large apes was sent to Dr. Eavage. of Boston,
by Dr. Wilsom, an American misiunary river. Simce that period skeletons and skins of the river. Simpe that period skeletons and skins of the
have not onily bech rectived, bat also cousilerable i formation concerming the animal's halits and onnde of living. In MI Dis Chatiln's, "Explorathoar and Adven-
ture in Kinaturial Africa," there are ture in kquatorial Africa,", there are oome very inter-
esting acconuts of the $G$. Considerable donbt has been chst over several of the statements in the work, but the Darrative is comsiderem in the main trastworthy thy Pro-
fesoor Owen and other scientific authoritios. Tae punta of difference between the G. and the champazzee are as follows: The gin
rilla is much longer that rilla is much longer than
the latter animua; the ordmary height of a full growo male is between mches, and it is probable that many of the largest size excued six feet in huight. Itd strength is remendoas, and its skeleton indicates treat power
in the jaws and limbs. the eyes are very promi nent, and the sknll of the male extubits a large oc cipital ridge on the tup ot the head. The brail is. sionhe and the nassid
bunes project more thian in the chimpanzere: these peemhiarties five to the
animal in hideone resenblate to the haman face. of that fuce projert very much, and the teath da not form at uninterrapted series, as in man. The camine tecth are y ary lirge, and the molars
bear a greater proportiun to the incisors, thus again ayproaching the

Fig. 1182.
EEELETON features of a haman bere shoulders, nearer to the human furm in ribs, and approaches than any other apte. The legs, although shorter in pro portion than those of a maa, are longer than those of the chimpanzee. Then standiag ereet, the an ms nearly the ground, and the freat tue formed for walking on hatuls are remarkible for their great true thamb. The the hingers being short but very thick. The skin of the gorilla is black in color and coy-red with of the hair, wheh changes to a tawny lrewn mn the head the chest is bare. The month. The face is hairy, bot taere is scarcely any appearrancu of nock. The eyes are much sunk. and in keneral the comat-nance is marked by a ferocious acowl. It is a voracions feeder, its fiveit hemg exclusively veg.talle; ;and its belly is very large and protninent. Gorillas are not gregarious in their
halitat ; thy generally live on the ground, but sponi nuch of their time in climbing trees in sear of peni Th ir inmense strength enablex then to defead them orlves againat beats of proy. They live io the densed parts of the tropical forests, and are much drembel ty the imhatitump. As yet the gorilla has nut been tamed, and it wonld appear $n \times$ if it were incarable of being so in an adnte state. Many stories are told of the gurilh bung mashe to work hy the fuhabitants in some party of Western Africa: these marratives are perfoctly

 larly of the great tow, It ore bra nomily lut probus ulof the tuther ; and io lumporitiry. The nttin $k$ is umanly

joint of the great toe. It returns at longer or shorter generally the preat toe is the chief seat of the disease Sometimes the nttack comes on withont any previous warthing: but usually, for some days or weeke before,
the putumt has been suffering frolo indigestion, with the putient has been suffiering truto indigestion, with dimunshed appetite, flatulence, enstiveness, , whd a gengras to bed, perhaps, io tulerable health, and after a fow bonrs is awathened by the severity of tie pain in the vreat twe or sometmins the ankle, heel, or calf of the leg. The pain retembles that of a dislucated bone and is attended with the sensation as if cold water wis poured over the part ; and this is succeeded by chilhaess, ohivering, and otber fetrile symptoms. These eridually abate as the pain increabes, and it continnes usualiy to the following night, with sumetimes, how ever, a period of iatermissiun during the day. The puin
is of it burving or ghawiag cluracter. The next nifitt is of a burving or gnawiog character. The next nisht, atter some time of tassing and restlessiness, the pathent suceetis he awakes to fiad hiuself retresbed, and the pute fimb next murning it is funnd to be coasiderably bwollecs the tue rediand shining, sud the veins of the foo mu'b distended. There are nsually a number of ontse quent attasks, becoming less and less severe, betor whit is kuown as "a fit of the grot" is over; so that it commonly exteads over a perriod of several weeks, or even aouiths. Wheu the fit is over, the system is ir lieved, and the person feels, buth is mind and bedy,
mach better than before the atlack. At tirat, a fit ot mach better than before the atiach. At first, a nit on
gont uccurs only once perhaps in two or three years Got it teccones by degrees more and mura frejuent more severe, and of longer duration every succeeding fit In ite primbress, various pirts of the budy become affected, huite primfress, various piatro from one joint or limb to atiother; and after frequent attacks, the joints lusu thein otreagth and flexibility, and become su stiff as to be deprived of all motion. Concretions of a chalky appear ance ure likewise formed about the juints; and afiec tious of the kidacse armse from a depusit of the same
kind of mater in ihem. This onatter is a componad of kind of mater in them. This matter is a componad or uric acid und sodit. The fits are more apt to occur in spring or antuan than at other selasons of the year
probubly uwjur to the varfableness of the weat ber at
 these times. As the fits become more frequent and 8 severe, 80 the cunstitnthomal derangements indime more
marked and constant. The appetite faile, indigestion is mare constimet, there is a teudency to costivences, the mind becones restless nnd irritalle, calcarcous dy posit are furmed in the arteries, calculi forat in the bladder and frequently the beart becomers diseased. Siech ard the general teatures of what is terwed the regular gout; but there are certan other kinds which differ widely from it in their general character. In otomic gout, toe disease instead of manofesting itserf in the joints, ntiteck some of the internall orgats, as the stomach, Hhen toe putient sulfere trouz iudggation, naasea, vomiting, and bevere pains; or the thatrucic viscera, when patpitations,
faintins, nad hanthna arise. Retroccdent gout (Lat. puld gra recrogrexa) is "hen, ater mo inta, und is trus tervel to some inturual pirt, as the stomach, beart terrea or brain, when it mity give rise to various fatal disordere. Mispluced gout is whel, instead of attacking the joints, the disease procceds inward, and canses ail intlammatory afiection of some of the internal parts. with the sime symptoms that attend inflamonation of these iarts from other canses. The canse of gout is th excess of aric acid in the blovd, resulting either from an excessive formation or it cbected excretion, for there is reason to believe that this substance exists in very mimite quamtites in dis bood exen in perfect hatith Tuphical remedars are of hittle ase moon. Tr the patieu is parrint in diet und suderifise The use of colchinal is ben.fical duriwy a fit of mont, but is rupuires to ve wed with cantion. The mast efficinut cur this diene heweyer, is stret attention to diel and plenty of active exercise.

Arabows, (yratbe, tho mame of several towns in Germany, then

tribuno atad refirmer, in. alwut y, c. 164 , Ihed foman eldeat sun of tho consul of the same nume, and ur Car nelia, danghter of Scipio Africanas: mat losing him futher at un carly uge, wha brought up by his noble nuw ther, with the had of fireek tators. He untriad tho danghter of Appins Clandms, chief of the semate, mat soon ufter distanguisbed himend under scijde at the
sicge of Corthage. At the the of about 30 ho surved ts quentur io spain; but decply moved by tho frikhtal evils wheh be saw in the state of laly mulite fopubit tion, he resolved to devote bimself to the task of retorm, stabll landed properictors. Hecontered theonleo chas of a. c. 133, nud soon proposed a meataro reviving with
 for the thare equal distribution of the pmilic lands. This measure, engerly welconed by the conatry-triben ronsed bitter upposition on the part of the rich holders of thase lamels, and at their instance Octavins, one of the tribunes, interposed his veto and prevented its passing into law. This course was ripeuted on a acond uttompt of $G . ;$ but at a thed assembly Octavins was deposed
and the bill passed. soon atter, $G$. made a proposal lor distribinting the property of Altalus, king of yergamum He miso bronght forward sevoral measurus of retern which were subsequently carried by his brother caving On his off riot himself a candidate for the tribuneship the next year, a riot arose, the semators making matam th npon the farople, end the reformer wos killed with many of his adberents. His botly with thers was thrown into the Tiber, leave bring refused to cains to bury it.
Gracches, Catts skmprosites, yonnger brother of the
precoling, and like him tritano and ruformer, n , abont precodang, and like him tritano and ruformer, n, abont his absence was namell one of the commiseioners for carryiug out the distrilution of public lands. After hix be was sent as quastor to Surdibia. Two years later, dis regarding an order of the Sonate, who would thin huve him absent, he returned to Rome nud was chosen tribune. Ite was by carelul sthdy an\} training an accouplisked orator, and lie applied all his powers to aveuge the death of 'iberius, and to carry out his meusurs Ho repewed and extended the Agrarian law; plante new colonies in Italy and the proviners; provided for the sale of corn at a low price: dearived the senate of
the judicial power; and had new roads made and pld the judicial power; and had new roads made and uld ones restored in all parts of Italy. These measures tribune for Jos mur unce prousd wide extere of the Koman franchise. To diminish his popularity, the Sonate emphoyed Livius Drusus to onthid hum for popular faver. At the same time Caius was sent, with his chict supporter Flaccus, to Carthage, to establish the new coluny there. Lle was not again chosen tribnne, and at mevturg of the senate was callod to ruwke one of his
laws. The irritatoun was immense, the frionts of Gravchas were armed, blood was shed, the great reformer wats declared a pulalic epeory, and in the conthat which took place next lay three thousand are said to lave Callen, and Gracchus had his slave put him to death. Cirafter, n. One who grafts; one who propagater frot, de., by ingrafting.
in rafliasty, $n$. (Arboriculture) A mode of propagating plats which is applicable to most kinds of trees vegetables, which exception of heathe nud herbaceous tion. It is principally dirceted towards fruit-trees, in order to cantinue their varicties. A troo which is graft ed cousists of two separate parts,-the scion and the ntock; the union of these two constitutes the graft, mh The operntion by which the umion is effected is termet grafting. According to London, tho end of graiting of fruit-troes endowed, accidentally or otherwise, with particular qualitiea, which cannat be transferred to their offipring by keots, anl which would te multiplied too slowly or in-ffectually by any other moto of propaga tion; secondly, to accelerate the fructificution of trees hirren as well us fruit-hearing; thirdly, to improve the yuality if fruits; fourthly, to porjuctuato varletled of
ormanental tress or slirulas; and lasdy, to change the ormanental tress or alirubs; had asdy, to change frich
 propugating fruit-trecs. It is ancersaiary, in arder to perform this correctly, that the top of the stock and the
extromity of the scions shoull be of equal diamoter. The
scion and stock are ent off obliqnely at correspending angles, or ad near the sama ns the operator cab guess;
a sht is then made in the sloped face of the stock downwarde, and in the scion upwards; the tongue thas conetructed of the scion is then inserted in the eleft of the stock, the inner barks of heth heing made to unite closely, and the whole is then bonnd round tightly with base riband from left to right. The next thiag to be done is to clay all round, over the bass, from about an

inch below the graft to ao inch above, cloaing up all the apertures, so that no light, wet, or wind can penetrate;
for which olject the clay is applied. Cleftgruffing for which object the clay is applied. Clef-gruffing the above method io the scion being elhaped like a wedge, and being inserted in a corresponding cavity in the stock. Shoulder-grafting (4, Fig. 1184), nsed chiefly for ornamental trees, is performed by cutting oblignely, and then cutting across a 8 mall part at the top of the stock, so as to form a shoulder, the scino being cut to fit it. - In grafting, it is particularly to be atteuded to that the alburnum of the scion is bronght into contact with that of the stock. The hard woor of the oaw uever
unites with that of the other, remainiug separate and marking the place of the operation even in the ollest marking the place of the operation even in tbe oldest
trees. For scions or grifts, pieces of about six to eipht inches long are generally taken from the shoots of the previous summer, with several bude; but portious of bhoots of two years old are sometimes auccessfully employed. The time for grafting is in spring, us soun as the sap begins to appear. The scion should, if possible, he takeu from a bealthy and fruitful tree, but scions from the ex tremities of lateral branches are more likely to become speedily fruitful that those from the appermost branches, where growth is most vigorons. The that the stock may rather exceed it, not only in vigor but in the progress of its epring crowth; oud for this purposo may be placed in the ground, in a rather dry purpaso may be placed in the ground, in a rather dry
soil, sheltered from the direct rays of the sun. Scions may be kept for some time, and easily carried to a distance, by eticking their lower enl into a potato. - The progress of the huds shows the mniou of the graft and stock, but it is not generally safe to remove the clay in less than threa months: and the ligatures, although then looseued, ara allowed to remain fur some timo longer. From somo kinds of fruit-trecs, fruit is offen obtained in the second year after grafting. - Budding, q. v., is in principlo the sama as grafting : and Fluten is used instead of a single bud, and a stock of sirailar thicked instead of a single bud, and ring of bart is ree moved, and the foreigu one suhstituted. This is conimonly performed in apring, when the hark parts readily, and is one of the surest modes of grafting. - Inarching, q. v., or grafting by approach, ith which the scion is not cut off from its pareut stem until it is united to the new stonk, is practised chiefly in tho case of snme valuable shrulis kepit in pots, in which suecess by tho ordianry methode 18 very donhtful.

which the grammatical terminology which had been to spread from theuce over the whole civilized world We cas follow the strean of grammatical science from Dionysins Thrax to our own thne in an almost uninterropted chain of Greek aud Roman writers. We find M. Ferrius Flaccus, the tutor of the graudsons of Augustub, and Quiutilian, in the first century; Scaurne, A pollonins Dyscolus, and his son Herodianns, in the second; Probus
and Douatus, the teachers of St. Jerome, in the fourth. Af and Douatus, the teachers orst. Jerome in the fourth. Af ter Constautine had moved the seat of government from
Rome, grammatical science received a new home in the Rome, grammatical science received a new home in the
academy of Constantinople. There were wo less than 20 Greek aud Latin granmarians who held professorships at Coustantinople. Under Justiniao, in the sisth ceutury, the natme of Priscianus gave a new lustre to gramtury, the names, orischanus gave a mew matical studies, and his work remained an authority during the Middle Ages to vearly our own times. We oursclves have been taught $G$. accordiog to the plan which was followed by Dionysius at Ronee, by Priscianus at Constantinuple, by Alcuiu at York; and whatever may be said of the improvements introduced into our systedi of edncation, the Greek and Latingrammure
used at our public schools are maiuly fonnded on the used st our public schools are maiuly fonnded on the fhist empirical analyoss of language prepared by the andria, and transferred to the practical purpose of tenching a foreign tongue by the Greek professor Rome. It is in the grammar of a langnage that we can rrace its distinctive teatures. The English language, ior conntry of the globe, - Latin, Grewk, liebrew, Celtic Suson, Danish, Freuch, Spanish. Jtaliso, Geruant, - uay even llindustani, Malay, and Chiuese words lie nixed
together in the Eoglish dictionary; Lut not a single together in the English dictionary; but not a single drop of foreign blood bas eutered into the organc system of the English language. "The granmar, the
blood and soul of the lauguage," (Max Müller, Lectures blood and sonl of the lauguage," (Max Müller, Lectures on the science of Language, 3 d ed. 1862, , is as pure and of the German O oean by the Angles, Suxons, and Jute of the contivent" Grammar is, after all, but declen*io and conjugation. Originally, declensios cuuld not have heon anytling but the composition of a notu with some other word expressive of number and case. The like holds true with regard to verbe, though it may seom difficult to discover in the personal termination of the to the rout of the yarb in order to express, $I$ love, thou lovest, he loves. It stands to reasou, however, tbal
originally these terminations must hase originally these terminations must have been the same in all languages, uamely, personal proouns.
very likely," says the anthor already quoted, "
gradual disappearance of irregular declengion ond the jugations is due in literary as well as in illiterate cosguage, to the dialect of children. The langaige of chil dren is mure regnlar than our own. 1 bave beard clit dren say badder and baddest, instead of worse and worst In trening of the G. of any language, grammariane nsually divule the sulject into four distiuct heads:Orthography, or the art of combining letters into syllables, and syllables into words; Etymology, or the art of deducing one word from another, and the various modi
fications hy which the seuse of any one word can bo difications by which the sense of any one word can bo dit
versified consistently with its original meaning, or ito versined consistently with its orginat meanmge, or it what relates to the coustruction or dne dispuaition of the words of a language into sentences or phrases; and Prosody, or that which treats of the quautities and accents of syllahles, mad the art of making verses. All language is nade up of words, which may be defined to be sound sigoificant of sume idea or relation, and may be distinquished as - 1 . Sulstantives ; 2. Atrributives; 3. Definpres; and t. Connectives. Substumtives are words ex of themselves, as whis exist, or are couceived the exis anythiug else. They are nouns and pronomus, the latter being a species of words iuveuted to supply the place of uouns in certaiu circumstancers. They admit of th acciachts of gender, number, aud case. Attributive are woriss that are expressive of all euch things as nr
concrivel to exist not of themselves, but ns the nttributes of othor thinga. They are verbs, participles, ald jectives, aud ulverbs. The attributes expressed by verb tuotion ir caschee in uration the time, therefire reph are liable to certain variations called tehwes. To denote the several kinds of affirmation expressed by verhin, all verbs have what is termed utooils or modes: ns the in-
dicative, I write: suljuactive, I may or can write; imdicative, I write: subjuctive, I may or can write; im-
perative, write thou. Verlis are also distiuguished an perative, write thow. Yeris are also distinguished and
active-transitive when the action denoted ly them pasem from tho actor to some external olject ; active-intransi five, when no sum hassing takes place; jassive, surli has oxprexs not action, Lat passion, os suffering; and notuter such ins express an nteribute that consists neither ackon mor in passion. Parliciples ary nuch words written. Adjectines exprexs, na Inhering in ther sulstautives, the several qualitiee of things of whith the essence consints aut in motion as ito privatina: as, ${ }^{\text {pond }}$,
bad, proper. Sume qualities are of such a mature thut vue subptures may have thes in o greater degreo than numblher: atd thereforo nilj ectives denoting these quali
 tributes, have leen called nattributive of the second order, to thetiuguish them froms verlse, participlew, autl
 Adverbe aro of twu kinde, - thuse which are comnueu
to ull attributives of the first order, $i$. e.. which coalesce equally with verbs, participles, and adjectives, und those as serve to define sud ascertain any purticular object or oljects as separated from othera of the same class. These are commonly called articles; of which there ar two kinds-the definite and indefinite. Comnectives are such words as mre employed to connect other words and of several distinct parts to make no complete whole. They are of two kinde - conjunctions and pre positions. Conjunctions are those connectives which are commonly employed to coujoin eentences, They are or two ktuas, -conjunctics, or such as conjoin bel as, while they conjoin seutemes dizion their meaning Prepositions conjoin words which refose otherwise to coaleece; and this they do by simnifying those relation by which the thinge expressed by the united words ar connected in Dature. Interjections are a class of words which are to he found in perhaps all lanquages, but they cantot he lucluded in any of the above chasses, for they are not subject to the rules and principles of grammar,
as they contribute cothing to the communication of as they contribute sothing to the communication of

$\mathrm{s}_{\mathrm{p}}$. granito, from Lat. granatus, buving many graios, from granum, a grain.] (Geal.) A kiod of rock, so named from its granular structure. The ty pical $G$. is a erys talline aggregate of the three miverals, quartz, foldspar und mica, with the appearanco of layers in the arrange ment of the mica or other ingredients. The proportion of the thrcu componetits vary indefinitely, with this limitation, that the feldspar is always an essential in grodient, and nevor forms less than a third, rarely les
than a half of tho snans, and generally a still lar than a half of tho mass, and generally a still largor proportion. Sontetman the mica, sometimes the quartz
comes so thimute as to be scaccely is in scales, white, black, or brownish, and nay he separated into thinnur seatex with the point of a knife, The quartz is usually grayish-white, and withont nay appearance of cleavage. The feldepar is whitish or flesheolored, and shows a flat, polishod, clcavagesurfice in one or two directions. Somo gratites are very close and fine-grained, others largely and coarscly erystalline. The cutors of the rock are grayish, flesh-colored, or white varying with the color of theconstituent mincrals. Por
phyritic $G$. (Fig. 1188) has the feldspar distributed in dis

 culve of the beat ntence, $O$. abonuls in New Fogyland

Excellent G. is quarried in Maine, Virginia, and Now 11 anpshire, but the most celelrated quarries are in Mas sachusetts. The Gaincy $G$. is properly a syenite. $G$. is detarhed in biocks of any leagth by drilling boles every few inches in the line of desired fracturo, and driving in wedgas of iron between steel chee s, or half-ronm pieces fittiog the sides of the hole. After rebioval the
rouk hardens somewhat, sod is legs easily ent than when firct taken from the quarry. $G$. is athonian in S. Carolina and Georgia; but much of it, is well as that of some farts of California add Anvergme in France, is in a singnlar state of decomposition, in thany places being easily provetrated with a piek. In
the sonth this cbatage hats been referred to the itetion of the sunth this cbasge has heen referred to the action of kulphurons acil vapur, suppusell to be prodnced by the
decomposition of pyrites. Dolamian called it the pala decomposition of pyrites. Dolnmien called it the malaacid from the interior. instances bowe decared, the the gutirtz mica in Theso aud place. The decompesition of the feldopar of some varicties of $G$. produces the krulin used in the manufiseture of porcrlain. When $G$ deconposes readily, it pusses into a good soil, uct naturally rich, uut caprable of hecoming so by theaddition uf organic matter. $G$. is widely distributed, many large tracts laing entirely made up of it, and in nuny places it rises into lofty and picturesque peaks, forming the inost magnitieent sce dery Gran'ite, io

Io is.is herved umter ordered to Gregon, and in Aug.. 18j3, hecame full captain. Ile resigned his coumbesinu in July, 1k5t, ant soun after settled in lusiness at Galena, 111. From thi privacy he was drawn aut by the Civil War, nad bavio ncted first us aide-de-camp to the governor of his Stitt in Is 61 , and afterwards ss colonel of the 2lat Illinois Volnateers, was appointed a brigadier-general in July of the same year. While in command at Cairo, he secured Piulacall, and with it the State of Kentucky. In Niv, 1S6l, be fought and gained the battle of Belmont, and in lata. of the to the rear of Colngitius. After captaring For Henry, on the Tenuessec, Gen. G. pursued the Contederatus to Fort Doneloub. There a severe battle riked hlmost without iuterruption for tirce days and three iights, when, Feb. 15, the fort was sarrendered macol dimually. This Imiliant feat elevated Geas ci. to thin rank of :a jor-general. 1faviag been appointed to th cobmand of the district of Tl. Cewnessec, G. adranced up that river ta littsburg Landing, where he had to content against a force of nearly 70,000 mea. The Nutional lines were averwhelmed, crushed, dispersed; but Gen. G.. undismayed, formed new lines, planted new barterius, athen the lous expected arrival of his rear-guard of 35,000 men, wader Gen. Bucll, enabled him to fight, April 6 th and 7 th, the glorious lattle of Shileh, wheace the Confederates, alandoming the field, retrested to Corinth. Gen. G. was sceond it command to Gen. Halleck at the siege of Corinth, atad when tho latter wits ordered to Wasliugton, he was appoiuted to tako conmand of the Department of Tenoressee, is which capacity he matrehed arainst Virkslarg, the so-called "Gibraltar" of the Coufederates un the Mississippi. After a loog atud memordile singe, this importaut place was surrendered unconditionally, and introv prisurners, 150 cambut, with
an immose atoonat of miliary stores, fell into the
 at Chick on onga, 6 . wis sent to repar the disaster, and on Nov, 25 , 1stis, he defented (ien. Brage at Loukont Mmintaith. This great victory, ly which E. Tennessee was reduced and Kentucky sived, was perbaps the most brillint stratt-gic and tactical movement of the war; it plased Gen. $G$. on a fouting with the ablest generals of any conntry or of any age. A few months ater, Mirch in the land, - under the titlo of lientenant-general he wat constitnted commander-in-chief of all the armies plan of Gen $G$. wis to destroy Lee's army. Whasliagton plan is to the corered from raid, throngh the Shenamduah by Gen. Sig.l. Ghor. Butler was to menace Richmond by Gen. Sig.l. Gno. Butler wits to menace Richmond
from the south. Sluerama, in Georgia, was to press his campaign in that department with all vigor, that ao reinforcements raight be sent to the aid of Lee. Gen. $G$, with Meale's ariny of 150,200 ntirth of the Rajodath, wats to draw lee's army ont of their intrenchments, und either destroy them, or compel them torush from the medacing of Washington to the pratection of their own capital. On the nigltt of Tuesday, May B, Gen. G. crussed the Rapidan, and entered what is called The Wilderness. By a flauk movement, $G$. Was getting into the
rear of bis foe, Lee rushel from his intrenclanents rear of his foe, les rushel from his intrenclabents
and endeavored to overwhelm $G$. Then began the most and endeavored to overwic and terific eampajga recordnal in histury.
 tles, the two armies, on the lizth day of this maparalleled struggle, were still confruating each other, both on the

Weather is moist or cool, they are sometimes seen to fly to
considerable distances. Whew rougbly havdled they lite sharply, and when flying they make a particu noise with their wings. Sue Locestarlase, p. 1500.
Grass'hoppe
Grass hopper Falls, is Kansas, a port-village and tuwnship of Jefferson county, ibout 23 m. S. W of Ate ison.
Graws'iness, n. [From grassy.] A grassy state, or one
Grass Lake, in Michigan, a post-village and township of Jackson ce., on a small lake of the satue mme, abt. 65 m . W. of Detroit; pop, of township abt. 2,600.
Grass Lamil, n. (Agric.) Uoder thim name are included water-meadows, uplaed pastures, anil artificial uteadows. The first are briefly treated of under Lariostion. Cplant prow spentaneously, varying in quantity and qualit grow spontaneousiy, varying in quantity and quanai Ty rich, the ouly care required is to etock it judiciously, to move the caitle froquently from one spit to another and to eradicate certain plante which are useless or noxions. The urige of the cattle is the manare which chiefly keeps up the fertility of grass-land. A poor, arid seil is not fitted for grass, nor one which is too wet from the ahundance of springs and the want of outlet
for the water. These dufecta can only be remedied by for the water. These dufects can only be remedied by
expensive improvements. When an arable ficld is sown expensive improvemeuts. When an arable ficld is sown
with the seeds of grasses and other plants which give with the seeds of grasses and other plants which gi
herbage for cattle, it is called an artificial meadono.
Grawwland, in W. Jirginia, a P. O. of llarrisou co.
fraswlanis, in Wratigg or withont grast.
Grassless, $a$, in auting, or withont grats. cemnty.
Gravs'soil, $n$. (Perfum.) A volatile oil of a light strow Gravy oill, $n$. (Fer ludia, of the gemus Andropogon. It is fararant, pumgent, and stimnlatiug, and is used io perfumery und andicine. It belongs to the oame chass in chemistry as oil of lomons. ered with grass; as, "grass-plots bordered with thowers."
Grass'-poly, $\quad$, (Bnt.) See Lifthecm.

as wheo one body toods toward another, according to as wheo ono body tuods toward another, according t the law of gravitation; to tend toward the ceutre.
Grasita'tion, $n$. [Fr.] (Physics.) A term often nsed synooymonsly with grarity, to deoote that mutual teneucy which all boures in tuture have to appronch each aversely prcportional to the squares of their distances Tbat every particle of matter in the uoiversa baa a disposition to press towurls, ind if not puposed to approuch to every other, is a fact of which we derive the knowledge partly from our constaut experience of what takes place at the earth's surtace, and partly by reasouing from tho observed motious of the culestial bodies. This mutna! tendency of all the partickes of natter to each other is called the attraction of gravitation. In reference to auy particular body, or mass of matter, the aggregate at craction of nll its particles is usually called simply its gravity. Universal experience demonstrates that nil beavy bodics, when ousupported, fall toward the surface of the earth. The direction of their motion may be perpendicular to the level surface of the earth - that is, perpendicular to the level surface of the earth-that is,
to tho surface of stagmant water. But the earth is very hearly githerical, amd a liue perpendicular to the surfaco of a sphere must pass through its ceatre; heuce the direction of a hedy moving is consequence of the force of erreatrial gravity is towards the cemstre of the earth. And this is the direction is which it must nove if the foree of gravity is the resultaut of the attraction of al the particles of terrestrial matter on the fulling body for it has been dumonstrated hy Newton that a spher Httracts an exterior body in tho same matumer as if nil ere. As bodies whea left without suppurt fall from all lucights to which they may bo carried, it muy bo inferred that gravity acteon them during the whole timo of their That gravity acta on thens during the whole time of their This tuightalsu te inferred from the fiet, which is casily entared tonatite, that bodits which fall from a greater height urrive at the ourth with a greator velacity. But Gilileo was tho first who proved, by "xperiments, that tho accelerntion of falling tocties is uniforin, and thit the npmos through which they descend are conaequently ns the equares of the time of descent. The best metho of slowing, "xpernnentally, that gravity is a anformly accelerating force is by means of Altwernds marhin word ATTwoon. Terrentrial wravity acts equally on all bouljes, that is to suy irupreasig un all of them in oqual boulies, thut is to suy, impresests on alf of theth an oqual piroperty of gravity was atao domomatrated hy fialileo. tor, ho cuclosed equal weishte of tifferent sulatame the sphurws were suspunded hy atring of eqnal lowgth, arel made to vibrate in very stanall aren, when it whe fonded that the titne of oecillation was the same in all of thetm. Comann experience wamblacom to le at varianc with thin result. Light boilion, an feathera, juy"r, isc fall mowly and irregnlarly : and mone rubalaneta, in known, virnsere from tho buosan'y of the ntmonphero. In the exhanated receiver of an air-pumpa a piece of gold
$10 \overline{5} 0$
and a feather fall with the same speed, and striks the bottom at the same time. - Having oscer taiaed the law of theng to wbich gravity acts on bodies st he surfsce Iute iourh, the next question is uagiven time. On acconut of the rspidity of the descent of heavy bodies, this cacaot be done by direct experiment; nor could Attwood's machine be employed for the purpose with sufficieat certainty. The ouly mode by which an accurate resolt can be obtaincd is by measuring the leagth of a pendugiven time. From experiments piade with the ureatect given time. From experimeats made with the greateet
care, it appars that the extreme amount of the varia tion of the gravitating furce between the equator and the poles is one part in 194 of the whole quantity; that is to say, iny borly which at the equator weiphs igt 1 lts , if traospurted to the pole would weigh 195 lbs. The differeace of gravitation, therefore, at the equater and the poles, is expressed by the fraction $\frac{1}{194}$. Now it has
been demonstrated by Newton that the ratio of the centrifugal force at the equator to gravitation there is $\frac{1}{2 \frac{1}{5}}$. This is consideratly smaller than the fraction $\frac{1}{19} 4$; hut the differeace, which is $\frac{1}{5 \frac{1}{50}}$, arises from the oblate fig nrs of the earth, in consequence of which a hody placed at the pole is at a less listance from the centre than one at the equator, and is therefore attracted morn than it Would there be coasequently oo centrifngal forca. From this it may be readily the intensity of gravity, or, in ether words, the fignrs of the earth, may tue deduced from the number of oscillations of the peudulums of the eame construction wruld perform in 24 hours in places situated uader different istitudes; or it might also be deterwived from a com parisoo of the different lengthe which must he given to a peodulun in order that it muy perform in every place tho sama onmber of oscillutions in a given time.-IniversalGraritation. A though Kupher made some shrewd Cuesses at other similar phenomena it is to sir Isaac tides and other similar phenomena, it is to sir isaac plications of universal gravitation, ahd through it, by plications of universal graritation, and through it, by rect iuformation that we have with regard to the move meuts of the earth, sun, and moon, and other heavenly bodies. The first rule is one which is very compreben aive, and which gives a good idea of the h bole bisis of the science; it is, that the attraction of one hody upon another boly does not depend unon the mass of the body which is attracted, but is the same whatever be the tuase of the budy so attracted, proviled that the distances be the same. Fur iastance, the plact Jmpiter aftracts tha sun, amd also attracta the enth; but althongh the sun of Jupiter un the earth is exactly eqnal to his attraction of the suo, becatuse the corth ond sun ore ertuatly distont froas Jupiter. Ooe of the simplest illustrutions of this force is that of throwing astome in a straight or horizuntal plane, when the stone's course will be evelved it a curve, and the stone at length will drop to the gronnd. The flights of shot und shell are likewise illustrative of the eame rule. (See Guxneriy.) New ton, before applying his theory of universal gravitatinu, sought for a law by which he could regulate the diminiahing intenbity of the same, aod, nfter severnl experiments ath caldimioishea exactly as the equare of the diatanco it dimioishea exactly as the equare of the distanco it the earth at the distance of the moon must be ns eanch lus thau it is at the surfice of the earth, ne the square of the radius of the marth is lees than the nymare of the mon's distunce from the eath. Newton also funud, that since the trine diameter of the meon is to the trit dumeter of the curthiss 100 is te 3 tiv, the mass of nutter in the moon is to the muss of mutter in the earth in the proportion of 1 to 39,4 sh; and alno that the accelorative cravits, on the kurface of the manorir to the accelerative cravity on the surfice of the earth, An 1 in to 3 , or is jua agher an atractue force wheh diminishwa accord ing to the invers sumare of the listance, unet accord ing to the inversen mare of the discance, mant aleacrile also that they must confurm to the laws of motion which Komberdincoverad to belong to the platetary arbas, Nuwon likewise was sucesssfinf in determiulag that most of the inequalities of the moon and the phasets are corne quences of the momang gravitation of the differont bodie which compise the varions eystems upon each othor hut in ndtition, that the kame incomprachensible puwer not ouly regulates the motiona of the different planets and xatelliten, but also canses the precessimn of the equiboxea, protmers the the
 furm many conclunious usto its nature, mude of action, and inllumence. Wieseo that gravity is a force which is tranmitted frum lmaly to lual x instantemmasly, nud nes aseressively; for wree we ablo to monarre ita tratumision, that in, if we renider it in the light of belng transmitted nucesaately, we wothl find tant the sicula ariaton of the mean finar motion would bo mensilly affereted. If we conmider the guewthon whether gravity in affereted by the denslty of the bodlen through whici It han fur pum in order to ntiract uthor lnuliev, we wath ho forcer to ogrese with laphace, that it Is of no nubtilo ind afl-puwarmi s matter, or forwe, that bot elell th
 acted mpou. In concluding this nubject, ft may be rad
that If the earth's flattening at each of its poles were greatur or lese than 1-300 fiect of this alu-ratiun on the moon would, is changing tho position of its fuadameatal plane, thus produce an inequatity io tho loagitade graater or luhind her mem which the maonis somedly the deduction cats be drawh, phace. And, coaseque moon, theoblateness of the earth that by observing the moon, theory bat been found to be true and jnst ia its foundation, it is one of the most true and
striking testimonies of the correctuess of Newtun's laws of aniversal gravitation.
irav'itative, $a$. Tending to gravitate or be attracted
Grav'ils, n. [Fr. grarite; Lat. gravitas-gravis hravy, weighty.] Seriousness; sobriety of nanuers ntaillacss of disposition; solematy of deportme
character. Weight; relatise importance; force of circumstan enorinity; as, accorditg to the gravity of the case. Mns.) Lowness of note; depth of souud;-correlatix to acateness. of a ing upon the part of the body on one side of this point ing upon the part of furce of gravity actiag upon the part on the opposite side, no matter how the body may
luo placed. The centre of gravity is not always in the body itself; the centre of gravity is not always in thic fasteued to the sides of a ring so us to pats throngh ita centre, it will be fonnd that the ring will rest in any pesition when the coatre is supported, and that cont not thus remain at rest on any other point. The centrout its whole extent is at the ceatre of the ring. If on part of the riog is leavior thin the other, the centre of gravity will be found to be between the centre and he heavier part. When two connected by a straight ri (Fig. 1191), the centre of gravity will bo found to be at the ecntre of the rod. If one ball be twice as heary

gravity will be in the rod at a point twice as near the gravier bail as the lighter ball. If the beavier ball be three times the weight of the lighter bull, the centre of gravity will be thrice as near connected by a corved rod, the centre of gravity will no longer be in the rod, but in a straight fine which joins the balls. Its distance from the balls will be as explained above. - Whes a hody is at rest, it is said to be in equilibrium. When it is at rest in such a positiou that on beiag slightly disturled it again returns to this position, it is said to be in stable equilibrium. When it is at rest in sucb a position that on
being dly.hitly disturbed it seeks a new position of rest. it is said to bo in uastable equilibrium. When a body remains nt rest equally well in any position, it is said to be in indiffereot equilibrium. - In every case it will be found tbat the centre of gravity of a body seeks the lowest position that it can take. Hence, wben a body is eo situated that its centre of in any direction, it is io stable equilibrium; when any disturbance of the boly tends to lower its centre of gravity, it is in unstatle equilibrium;
when, on being disturbed, its when, on being disturbed, its nor falls, it is in indifferent equilibrinum. The broader the luse of a boly is. cooppared ble is its equilitrium. If, however, the bony is not upright, brinm, even when the base is broad. On the otber hand, a body many be in stable equilivery narrow. Thas the image very narrow: Thas the image 1192 is bslanced on ite toe hy means of the two heavy toe hy means of the tur theae balls bring the centre of gravity beluw the point of

pended by a string, and allowed to fiod its position of reat, the centre of gravity is in tbe line of contionation of the string. In every kind of machinery this important law, by which the centre of gravity always tepus to assume the lowest place, is lept constantly in view in nrrangiug the weight of different parts of a
engine. Gravity (Specific.) See Spectitc Gratity
Cra'sy, $n$. [Ger. gribbe, crispy remains of melted fat de. Low sax at drips from freef par.] The fat and baked or boiled, rerving nas a eauce or dressing for the meat when served at table; as, gravy somp

(Physical Geng.) No country is more remarkable for the irregularity of its shape, its shores, and its surface.
Its N. portion, Hellas, stretchee W.N.W. to E.S.E. for Its N. portion, Hellas, stretchee W.N. 1 . Acarnania to Cape Colonua in Attica. Its 8. portion, the Morea, is a peninsnla, said to dorive its modern
name from its aupposed resemblance to a mulherry-leaf. name from its supposed resemblanee to a mulherry-lean.
It is united N.E. to II Illas by the Isthmus of Corinth. The greatest length of the Morea, $\mathbf{N}$. to S ., is about 140 The greatest its breadth varies from 60 to 135 m .: it comprises abont half the ares of the newly erected kingdon.- The surface of Greece is throughout monntainsus, and as exist are principally along the sea-shore, or near the mouths of rivers, or else are mere basina, onee forming the beds of monntain likes, enelosed on all sides by mountains, or communicatiug with each other anly by deep and narrow gorges. Such aro the plains of Mantineia, Orchomenos, Stymphalus, Topolias, and Copais. The most extonsive tricts of plain country are in W. IIellas, and on the N.W. and N. shores of tho Morea. These are alsa the most productive parts of the conntry ; through the E . of Greece, as those of Bcentia, K. Phacis, Namenum the granaries of the eountry. The most flourishing cities of antiquity, ns Athens, Epplsie, Mogars, Corinth, Acgos, Sparta, und Thebes, wire situated in the midst or on the burders of these plains; and others, As TripoIiza, Leondari, Mistra, Q.sstonni, Patras, Missolonghi, Geitoun, and Livulia, which in modern timurs havo ranked among the prineipal towns in Greace, havo
bues nimilarly ficated. - Mountains. They belong to the Alpine system, being a continuation of the Julian Alps, Bor remarkablo in thrir who extent ober that of Pimin-runs N.W to S.k through the centro of Illllas, in far as the I-thmus of Corinth. On cntering Greece, the Piadus chain is supposed to be neturly 7,700 feet in height. It sendh off on its W, wido sume rages through Acturmania nad. Etolist, nul the range of Sonnt Kugurit or 11 -licon in Bieotia; lut its uffsuts on this side aro of very inforior hoight. The monntains of Acarnania in generid are ustimated at anly nbout t, 190 feet in con, has anly 5,7518 fout of elevation. On the $\mathbf{E}$. nide the irnuchas of Pindus aro moro lofty; Mount Gninma, the highest print in trivece, and near ita N. bonethry, is The emletraten Monat Barmassus is a part of the cen-

reach quite to the extremities of the four S . promonto-1 rivg of the peninsula. The enlminating point in this
part of Greece is Mount St. Elias ( Muygetos), in Mana, part of Greece is Mount St. Elias (Tuygetos), in Mania, ,900 feet high.-Riverz and Lakes. G. has no uavigable riverg, nor wouldany be worth notiee, were it not for the both soil and water of this celebrated conutry. The Aspri)Putimans (Acheleas), between Etolia and Aenrnania, is the largest ; the primeipal remaining ones sre the Gavios Mavro-Potamus (Cpphessus of Bieotia), which runs into the Lake Topulias, the Hellada (Sperchizts) Asupo, the Athenian Chphissus aud Missus; in the Morea, the Ronphin (Alpheus), Vitsilico (Eurotos), Ilineo (I'encus), Planizza (Inachus), Havro-nero (the ancieot $\mathrm{S}(y x)$, \&c. The priacipal lake is that of Topolias (Copais), in W. Bceotia, said to be 1,000 feet above the sca. There are a few iosignifieaut pools in the Murea, iucluding the Leraean and Stymphalian lakes so famous it classical fable. the Morea, from Corinth to Patras, is low and nurshy. and the iubat. of both those towns, as well as of Nauplia Argos, and Zeitoun, the plain of Marathon, and a portiou of that of Athens, suffer, nt certain seasons of the y ar, from maluria gegerated by stagoant pools. The want of uavigable rivers io Greece is obriated by the B. merous gulfo and inlets of the sea, which indent its coasts on every side, and afford unasual ficilities to commerce, while they add to the variety aud beauty of the scenery. The principal gulfs or bays are those of Tolo, Zeitoun, Egina, or Athens (Sinus Saronicus), and Argos or Nanplia on the K.. ; Koloky thia and Koron on extensive and beanifal Gulf of Curintl between llallas aud the Morea. Butween Eubors and the main-lawidure aud the Morea. Between Eubou and the main-lawi are eient Euripus. The shores of Greece are mostly abrupt The chief heddlands are, Capes Mantelo in Eubow, Coiomna (Sunium), and Skyllo (Scylluam) on the E.; St. Angelo (Matea), Matapan (Trenaruat), wad Gallo (Acritas Pr.), on the S. ; and Klarenza and Skropha ou the W. coast.-Geology and Mineralugy. The greater portion
of the country consists of secondary formatious. G.,

wheat, barley, and other cerenis; flax, whe, and oil, with
froits of Farions kinds. The figs of Attica were nad etn are fanned for the excellence of their Havor. Furests
once covered many of the hills, and snpplied tamber for once covered many of the hills, and snpplied timber for stensive in some parts. The most important promaize, rice, rillet, currants, and silk. Honey is producel in great quantity on Hymettus spid in some parts of the Pelopouncsns. The mulberry-tree is largels grown for the silk-worm; and on the Dorth and south shores of the inlf of Coriuth, as well as in Arcadia, and the west coast of the Peleponnesus, the Corinthisn grape or currant is most extensively coltivated. Vines flonrish in almost all parts, hat the island of Santorin possesses the Diest famons vineyards, with the greatest variety of grapes, and forDishes a wine highly prized by the Russiaus. The olive growy in $R$ wild state over all parts of G.; when intants pickie in vary large puatity, ws atople artiol of fuod. The eil of the olire serres to supply lieht end is used in cocking and for ford, as we emplos lintter Cotton, madder, tobacco, and leguminons planis grow ou considerable quantity. Frnit-trees arc especially fertile; figs and spricots are plentiful and of excellent quality ; orances, citrous, lemons, pomegranates, almonds, water-melons, gonrds, and others of lese note are widely spread, largely produced, and of excellent quality--Agriculture. The agricultural implements are still ns radeas in the days of the Peloponnesinn war, or eveu of Ifesiod; and of the cod to the scarcity of plotghing-oxen, ruggednes tillage count iryigation is enuagh boll, and dimeulty of even a more energetic prophtion. The hones ot the conntry-peuple are in most parts little better then mere hovels, and s large propertion of the arable land is nutilled. The modes of tillage nre of the most primitive kiod; and thus, though vearly half the male popnlation of $G$. is employed in ngricultural lahors, they make but blitht impression on the genemal aspect of the country, and inflaence little the amount of exports; in fact, they do not produce as much grain as supplies the wants of the population, and that, too, though a higher yield is given in many parts of $G$. than in other conutries. Much alhor, however, is bestowed on the cnltivation of the of the land helongs to the state; rent is paid in kind and is \& cortain proportion (one third) to the net pro duce, - Sencry. Travellers in $G$. petiemally speak in high termis of its scenery, of which Fig. 1195 may cive at idea. It has everywhere the finest ricws, and is interesting, not less from its natural beanties than its classieal associations, aud the rning of ancient art aud splendor scattered every where over it.

Yet are thy skies as blue, thy erage an wild;
\&uet are thy froves. aud verdant are thy felda,
Thive olfye ripe as when Jiperva smiled,
And still his boovied wealto Hymernus yield
There the thithe bee his fragrint fortress bullda,
Tbe freeborn suderer of thy nountain alr ;
Tbe freeborn smoderer of thy miounthin air
Apollo still ths long. Nong stmmict gilds,

Khere'er we tread, 'tis bannted, holy ground
No earth of thine is lost in vuigar monid,
And sll the Muse's tines kem Irnly toid
Till the seaie aches with gntiog to behold

cornice; and that it is by certain differences in these diisions and subdivisions that the orders themselves are distinurished. The Doric order may be realily discerned by having no base to the column, the lower end of the shaft resting immedrately on the pavement; the
shaft itatif is also adorned with broad shallow fiutings eparited by a sharp ridue, the capital being composed of a broad echinus moulding surmounted by an abacus, while the frieze is adorned at intervals with projecting pieces called triglyphs, which are about half the width of the lower diameter of the column, having tare apwo vertical grooves cut teeply into the material of which it is formed, the horizontal section of which is os the shape of the letter V, the outer edges of the piece being chambered off at the same angle. This order was in some imstances richly adorned with scolpture in low relief along the frieze, and in high relief un the metopes or spaces between the triglyphs, the tympanum of the pediment rising it an obtuse sugle above the extabla sure being also filled with sculpture in ligh relief, and requently wis perfe statucsished frum anch other the former by ite volutes, and the latter by its exquiitely carved foliage and its height, which is consider aby greater than that of the capitals of the Doric and lonic orders. There is little perceptille difference in the shafts of the columbs of the Iunic and Corinthian orders, or in their entablatures. The temples of the Grecks were generally placed on a level platform, coneisting of three steps (Fig. 1197) rising oue above another, sud of greater or less depth in proportion to the height and diamcter of the columos that were placed apon them. These steps were too deep to affurd the neuns of access to the temple, and it is supposed that intermediate steps were placed at intervals along the sie to another, and thus to sain the levelof the portioo. The Greck windows and dourways, like those of the Egyptians, were narrower at the top than at the botfom, the siles inclining inwards. They were getterally urrounded by a noulding, which was broken at the top of the winduw by a right angle, and torued outwards on ither side, for a sbort space, ill a horizontal direction, before resuming its perpendicular course, so that an rchitrave or lintel was formed above the window of the ame width as the sill below. The doorway was alway iu the centre of the proncos, or portico of the temple, pose of admitting light into the interior. The arch it pose of admitting light into the interior, whe shish is chielly charucterized by the use of the beam supported on colamss, by which an appearance of great strencth and olidity is obtained. It is also marked by its strict adherence to ontlines formed by horizontal lines, and lines hat are vertich, or nearly su, being frequently slightly nefined inwards. lit is a known principle in perspec the same direction present a slightly curved appearance to the eye of ab observer. To correct this appearance he Greck architects carefully eonstructed their carculy purceptible curve pe form of a very slight and asis, is it is termed, or a slicht olltwurd swellime nem he ruidull : which priaciple of construction was effected by meand of certinn fixed rules. The columas also, jutead of teing vertical, had a slight inclination inwards, sid their puvements, and the platforms on which the temples stoud, were construeted with a very slight rise on the contre. Mr. Pennetborne discovered the existence of these eurves in 1837, and the truth of his statenents was subsequently corroborated by Mr. Penruse, who exumined many of the ruined temples of Greece, and made careful measurements of their propurtions, Which led to a discosery of the principhes un which they ecture the Purthumon at Athens ( Y ig 1197), and the Temple of Minerva at Egios (Fig (3) may be cited as he beat exumples of the Duric order; the Erechtheum and Paudrosinm at Athens, of the lonic vrder; und the horagic 3omument of Lysicrates (Fig. 694), in the same city, as the most beautiful abd ahmost the only existing pure Greek specisuen of the Corinthath order. Examplen of the Doric nud lonic ordera, or rather udaptations of them, are common it modern architecture, onte of the best, if not the best, being the citrard Collece (Fig.
1160 ) in Philadelphia. There are but imperfect duta for dotermining the style of architectureadipted among the (ireeks for dwellinga of a private chariucter
Greek Charelh, also called the Greek Guthotic, the Orthudoz Grrelk, the Orthondox, or the Eisstern Church, the patriarchs of Constantinople and the propers of Home In conscquence of the political pusition of the city ns the seat of the imperial government, the Chareh of Constantinople sought to reader itnulf independent of the See of Rome. Disputew on varintis points of doctrine oncurred from time to time between the two chure hes, but the great breach dill not take place till A02, under the

 ourruptions of the clergy, and attacked tho wrome of the

Western Church. Several attempts were made on either side to effect a reconciliation, but in vain. The popes were anxious to effecta union in order to extesd their domimions; and the emperors of Constantinople, wben f the West by a promised restoration of the Easter Church to that of Rome. At a later period attempt were anade by some of the Protestant churches to come 0 an amicable urrangement with the Eastern Church ut with like unsatistactory results. The Greek Churel eures the authority of the Pope and buintains that the Chureh of Rome is not the only true Catholic church. It acknowledges no vicar of Christ upon earth like the Pope; disclaims infallibility, works of supererogation and indulgences. It rejects purgatory, but admits of prayers for the dead; and furbids all kinds of carved images, lout permits paintings, and pays a kind of secoudary homage to the Virgib and sibnts. It denles auricular contession to he a divine command, but pracises confessionattended with absolation, and sometime penance. It admits the seven sacramepts, but baptism is performed by immersion of the body three times in with leavened bread and the wine is mixed with water. The anointing of the body with the ehrism is allowed to all sick piersons as a means of restoring theis to health and purifying them from their sins. The secnlar clergy are permitted to marry but once, and only a virgin; and laymea are allowed to marry only three times. Like the Rowan Catholic Church, it accepts tradition as well as the bible, but differs from it, as well as from all Protestant churches, in maintitididg that the foly Gho proceeds only from the Futher, and not aiso from the son. The rituat of the Greek Church consists almost entirely in ontward ceremonies, preaching or religious more pumerous rarely resorted to. Their fasts ar of the Roman Catholics. The clergy are divided inte two classes, - the higher The clergy are divided int comprisines patriarchs, metropolitans, archbishops, and bishops, all of whom are chosen from among the munks and must live in celibacy the latter, the monks, or black clergy (from their dress), and the secular, of white clerjy. The lower secular clergy are the arch-
priests, priesta, deacons, hypodeacons, and lectors. The

the human race, yet the class of poetry under which they fall appears in them at its fill matarity; all the laws which reflection and experience can suggest for
the epie form are uluserved with the most refined tiste the epie form are observed with the most refined taste:
ail the means are enployed by which the general effect ail the means are enployed by which the general effect
cao be heightened; powhure does tho pootry bear the cas be heightened; bowhere dots the poetry bear the
character of a hirst exsay or an nosuccesful attempt at character of a hrst essay or an nnsuccessful attempt at
some higher poetical fijhits; indeel, as no subsequent pomens, either of aucient or moderu, tim no subsequent pletely canght the genuine epic tune, there seenis good reason to doult whether any futare poet will again be able to strike the same chord." (Mülher.) -Of the poets previous to Honter nothing satislactory is koowa. The namues of many of them, as Olen, Linos, Orpheus, Mosens, and many others, are preserved to us; but their
works are all luat. Tue poems which to works are all lost. The poems which have come dow o to us uoder their names are manifest forgeries. The Iliad is founded on the legends of the war of Troy; the
Gllyssey, oo the return of Odysteus (Ulysses). Various Qdysey, oo the returo of Odysseus (Ulysses). Various
other poems,as the "Batrachonyomachia," or Battle of other poems, as the "Batrachonyomachia," or Battle of
the Frogs atd Mice, are attributed to Honer; Lut they evidently beloog to a later period. The Homeric poems were made use of as roodels, and as a basia with which to connect their works, by a series of later poets, who are conumonly krown as the "cyclic," but of whose works only the titles, brief abstracts, and fragmente have heen preserved. Hesiod, the next great epic poet
efter Homer, was a Boeutian, and is believed to have flunrished abuut the middle of the 9th century hefor Christ. 11 is principal poems ars the Works and Days, the leading subject of which is the various occopations Theognia, containing a history of the origio of the Thengnia, containing a history of the origio of the
world and the rencalogies of the gouls. Lyric puetry worid and the gencalogies of the gods. Lyric poetry
aroase ou the decline of the epic, and was nuch cultivated from about B.c. 776 to the condntencement of the Pereian wars. The spirit of the times, and the varions contests io which the differcut states were engaged, greatly tavored this kind of poetry. Next to the golis, who were celebrated at their feativals with hymns, their conntry, with its heroes, was the leadiag subject of their sung; and in everything there was a more power
fol impulse towards meditation, investigation, and lator fol impulse towards nacilitation, investigation, and lator
for the attainment of a desired end than before. Ataoog those who were distinguished in the field of lyric poetry or in the improvement of music, history furnishes us fanilus. Tyrtien Archilochud of karns, inventor of the limarbus of Fiphesus, iaventor of the war-songs; CalAlemon the Lydian: Arion of Methyoun who perfect ed the dithyrambus: Terpander of Autivet perfect of tho barbitos (a kind of lyre); the tender Sappho of Mitylene; her countrywan Alceoos; Eriona, the contetmporary of both; Mimaermus of Colophon, the fluteplayer; Stesichorns of Himer.; Llyycus of Rhegium; Anareon and Sunonides of Ceos; Hipponax of Ephesus
 Tannerra, the friend and instructrest of 民indar. As
gnomic writers, Theognis. Phocylides, and Pythagoras deserve to be muned; and as a fibbulist, ..sup. In the but they ase, pruperly pluced here but they are pruperiy placed here ud account of the
counection. The greatest of alt the intsters of Iyric anog, however, way Pindar, born at c'ynoscepbatar, in Boetia, in one. c. .2.2. OO his numerous compositions wo written in commenmanatien four natimal festivale, - the Olympic, Pythian, Ne mean, aud Isthmian. The earlicst writers of prose were those who first engaged io philosophical specu-
lations. Of their writings, however, ouly a few frig. lations. of their writings, however, ouly a few frige
ments have been preserved. Thales wats the fousder ments have been preserved. Thales was the fumeder
of the louic philusopthy, to which belonged Pberecydes, Anaximander, Auapimenes, Anusimgoras, \&c. Pyth.tg: oras est.blished the Itali.in school, and was followed by Alcmeon, Tineans, 1 picharmis, Thengoues, Archytas, mans, of M M litus, about 540 o. silas of Argos soon followed; then Pherecydes of Le ros, Charon of L मapsasus, Hellanicus of Mitylene, Dionysins of Melitns, - all of whom preceded Iferodothus But are rather chromichern thas historiuns, in the strict sense of the term. The first great historian was Hero-
ditus of
 in atill preverved, and well entitus him to the name of
the "E.athir of IIstory." The dramat tuok its rise from the festivities with which the comentry peoplo solemnized the gathering in of the vintage, nnd which were acand suane measure of art wero given tin theos, variety loga. The first direct ntep to the intronduction of the drama was maile by Thespis, and by Phrypichus, n.e. 630-511. Eschylun, the frout porfocter of the tragle art, was born at Eleusia, $5 \%$ a. .o. Sopherles nad Enrijp-
idea, the other groat masters of tireuk
 iuto regular form by Epicharmis, who lived almati 590 we. Cratinus, Crates, Phrynichum, and Enpolis, are tophnnes, who flouriahed in the early part of the Bth century u.c. In whatint in termedt the " old comedy," puthHie and private charactera were int roduced by mame; but abvequantly it wan fortidhen by haw to hatrodure niny comedy" arose in courequence. The " new comedy" wann ntil furthrr mindifneition which comely first assumed in the age of Alexander. The earilingt writir of the new comedy was Philijphitran, who flourinhud 323 n.c.; nud the $t$ wo
 ic literature wero woat rewarkable. The pruse compo-
sitions that belong to this age were equally distinguished Thueydides, born tit excelfence. In history we bave nesian war is not onty the first specimen of what has beeo called philusophical history, but remains uosurpassed dows to the preseat time. The bietorical works of Xenophon, bord 477 в. c., though not equal to that of Thucydides in vigor of coloring and depth of reflecdescrine yet adorned with every grace of narrative and description. In plilusophy, to which the teachiugs of Socwritiogy of Plato, born a great imppuse, we have the born 354 B.c. Plato was enic., and his pmpil Aristutie, agioation, and loved to soar ioto the bith brilnat im epecclation ; while Aristotle wasa student and regiode of practicat resulte being the object of his investigations Ile dever entered the world of ideas with phan but everything he wrote embodied the results of careful and is works olservations, or coloparison of olservations His works emlirace the suljects of lugic, thetoric, physics, metaphysics, natural history, and politics. Plato Waus the Academy, oo the Cephissus, point of reanion Aristotie established the Peripatetic, school io Ahe Ly ristotie established the Peripatetic school in the hy Public discussios was the the opposite side of the city Solon, Pisistratus, Miliadench Pericles were oraturs as well ny lerislators, counsediond and generals. Pericles was the firt to cultivate the ars and to adora his mind with the teachinge of philusophy end geberal literary culture. The first rhetorical sechoo at Athens was opeaed by Georgias of Leontine. Uther sophists and teachers of rhetoric were Yrotagoras, Pr dicus, Ilippias, dc. Amoog the Athenian orators, whuse Works are extant, in whole or in part, are Antiphad
Adocides, Lysias, Isocrates, Lycorgno, Hyperdes Adocides, Lysias, Isocrates, Lycurgnos, Hyperides, Fis
chines, Detadides, Demosthenos, and Dinarchus. Mathechines, Derpades, Demosthenos, and Dinarchus. Mithe
matics was now cultivited, and geography served matics was now cultivited, and geography scrved to
illuatrate history. Astronomy is indebted to the Ionic school, arithmetic to the Itahina, and geometry to the Aeademic school, for mauy discoveries. As matheonaticiand, Theolorue, of Cyrene, Meton, Euctedion, Archy tas, of Tarentum, and Eudoxus, of, Coidus, were cele brated. Geography was particularly enriched by voy agee of dascovery, which were occasioned by conmerce The atudy of nature was likewise pursued by the philosophers and the healiog art, hitherto practised by the E. 8 clepisies in the tensples, was raised to a distinet scieoce by lippocrates. After the death of Alexander, althongh
literature still continued to he cultivated in Greece, yet hiterature still continued to he cultivated in Greece, yet,
till the Roman conquest, the primcip.l seat of letters and science was Alexandria; ; and this period is called the Alexumurian age 1ts characteristicy were erudi the criticism, and the study of selence; and in poetry pridcipal puota were Bion of Smyrut 'Thecrifits Are tus, Lycophron, C.tlimachus, und Marchus, Suas Ara tics, astronomy, and geography made great progress doring this poriod. During the Roman supreopacy, and dowo to the introduction of Cbristimity, the principal poet was Nuatuder; the most important prose writers Polybius, Apollodurus, Dionysine Thrax, Miodorus Sich-

\&reene, Nathanikl.
Rreene, Nat日anifl, an American revolntionary gen-
eral, o. at Potowhommet, Warwick co., 1 l .1 .1742 . His father was a preacher in the Suciety of Frienits. Yonog $G$.'s school-education was of the cimplest and anost limited charactur; lut by his own indastry he ston acquired a tolerable knowledge of the principal brameles of an English edacation, including history and onathematics. Il. made some propress io the stody of taw: he also early evinced a decided predilection for looks
treating on the art of war. On the commencement of treating on the art of war. On the commencement of
the troablis between the colonies and Great Bratian, he volunteered is a private (157t); but the folluwing year he was chosen, liy the Assemlily of Pbode Island, general uf the contingent furnished lyy that culony to th. army near Bostin. He was made major-gemerat in the Continestal army in 1756 , and accompanied Washingtom on his brilliant expelition into New Jersey near the close of the same year. He periormed a promiacnt part In the disastrous battle of Germantuwn ( 1757 ), on $w$ hich
occasion his coaraze and skill did much towards retrievoccasion his coarage and skill did much towards retriev-
ing the reputation of the American arms. In 1778 be

Was nppointed quartormaster-generil, and for norol-A township of Intrimon co than two yrare he fultillent the dinties of that pesition with faithinmes

Gilallo, (gwa'no The excrensent of sea-birds which hus accuanalated ages so certain tropical istands, principally along the ployel as a fertilizer by the inhabitants of Peru from the moat remote periods, and by its nse they have renaleng the coast. While the Incas roled, the birds were protucted by very severe laws. Aoy one landing on the guano island during the time the birds were breeding, or whokilled any of them at auy time, was put to death. In 1 isot specimens of 6 . were first bronght to Europe
by llumboldt, who seat them for exanination to Fourcruy, Vauquelin, and Klaproth, the best analytical chemists of the day. He described it as deposited in thic islands off thie cuast of Peru, and st, ted that daring 300 years the coast-Lirds had depusited $G$. only a few lines in thicknens; thus giving an illea what an immetise period of time lias lnen required to form the gnano beds. The bones and feathers of the birds are foond among the recent layers of the $G$., bat the older deprasta otten exhibit the appearance of the phosphate of lime rocks of the older forioations, and are an inter-
esting instruce of the conversion of recent accnmulaesting instance of the conversion of recent acenmalations of organic matter into what appears like an an-
cient rock. In the guano rock all traces of animal life ciedt rock. In the guano rock all traces of animal life
have disappeared, the heat and noisture of the tropics baviog induced chemical clownges that in the lapse of time have changed these organic deposits inte crystal line masses. A large portion of the Pernvian $G$. is imported fronn the Chinchat 1slands. These isliads, three in nomber, are 5 or 6 miles in circumfer ace, comphsed of granite and covered with $G$. in some places to a beight of nuarly 200 feet. No earthy matter is mixed with it. $G$. is also obtained from islands in the Caribbeall Sea, of the coasts of Guiana 2 id Venezuela. There is no doubt of the great value of $G$. as a fertilizer. The Peruvians have a proverb respectiog itsuse which nfirms
that "lluano, though no saint, worky many miracles ;" that "huano, thouyh no saint, worky many mirucles;
but to successfnly and economically apply it, its combut to successfnily and economically apply it, its com-
position should be niderstood, and the nature of the soil to be bensfited and the method of its application considered. There are great differences in the qualities sham-fill aulutterations so locality, and the gress and great caution necessary in its purchase. G. contains a large percentage of organic matter and ammoniacal alte, varions phosphat's, and some alkaline salts. sample of first-class Pernvian G. yielded about 15 per cent. of moisture, 51 of organic matter, 22 of phosphate of lime, 2 of silica, 3 of phosphoric acid, and 6 of alkaline nalts. $G$. from dry climates where but little rain falls is more valuable, as it retains nemrly all the solable nitrogenous nid phosphatic compounds. That from he constitnents, but still retais the posphates of lite constiturnts. but still retains the phosphates of lime Peruvian $G$. remaining in ldi gave over'2 mallion tous avanlable for cotmerce, but this figure presumably in cludes ail the varieties, both nitrugenous and zhusphatic. filla no, a town of kcuilor, about 80 m . glidan, to pay, because each member was to pay some-
thing towards the eupport and charge of the company. A society or body of individeals assuciated together for carrying on commerce, or some particular trade or business. There existed at hotne various frateroities of tradesmen, which bore a considerable resemblance to our modern $G_{\text {. }}$, snd were permitted to regulate their affairs by their owa laws; bat is ususi w trace the origin of $G$. to the Middle Ages. Mechanical industry would oever have floariebed under the feudal system, had it not beea for the ontons formed amoag the workmea and merchants themknown and felt, they rapidly increased, and io the struggle between the citizens and oubility, the principal reaistane gainst the latter was made by the $G$. or corporstions. A suon as the citizegs reqeired an infuence in the administration, the guilds became the basis of the municipal coastitutions, and every one who wished to participato a the municipal government was obliged to become member of a $G$. Hence we so often find dittiagoished individuals belongiag to a class of mechanics of whose occupation they probably did not kouw anything. $G$ introduced the denuocratic element into society, and in their progress became the balwarks of che citizen e
liberty, and the depositaries of much political power. By Thberty, and the depositaries of much political pewer. By throughont the cities of Europe. The Drapers' Company of Hamburs dates from Ils and that of the Sho makers of Mardeburg from IIoñ. With the increase of their wealth aud etrength, the $G$. either purchased or extorted from their rulers privileges, which, ose tained, they were careful never to give up. By the 13th cent they had acquired coosiderable power, and in two snccessive ages they counterbalaoced the power of the nobles. By degrees, they themselves grew into intolerable aristocracies, especially in Germany, where their exactions had to be curbed by the laws of the empire. G. Were aholished is Prussia in J810; but the want of such associations having since been felt, laws were France, they were suppressed in 1776 , but soon re-e liehed, aod not finally abolished till 1791. In Eogland and Scotiand, the exclusive privileges of the guildry companies have oow been abolished.

Gnillotine, (gil-lo-teen', ) $n$. Af instrument used io France, for infliction of capital puishment by decapitait was introduced ioto that country. This person was born at Saintes, and became a physician ut Paris, where he obtaioed a certain celebrity, io the eariy periud of the Revolution, by the stroug part which he touk in favor of the rights of the Tiers-Etat. He was in con6equence elected a deputy to the National Asscmbly. Whea that body was occupied in its long discussions relative to the reform of the penal code, in 1790 , Guillotin proposed the adoption of decapitation, up to that time used only for nobles, ss the only method of capital ponishment. From sentimeats of humanity, he recomlong known is Italy under the name of mannuja, and in Scotland uoder the name of maiden. The A>sembly approved the idea, and the machine wrs adouted, to which the Parisians have given the bame of Guillotine and of which Guillotin is most erronenusly supposed to have been the inventor. It consists of two upright pieces of woed, fixed in a horizontal fruone: a sliap
blade of steel moves up and down, by means of a palley blade of steel moves up and down, by means of a palley is grooves in the two uprights; the edge is oblifue, io-
stead of horizontal. The criminal is latid on his face, stead of horizontal. The criminal is laid on his fice,
bis neck inmediately nuder the blade, which severs it bis neck inmodiately nuder the blade, which severs it
at a blow from bis budy. It is equally a vuluar error at a blow from bis body. It is equalty a vulgar error
that Gaillotin perished by the inetrument which heure bis name. IIr was ioprisoned dnring the Reign of bis name. Ifr was iouprisoned dining the keign of
Terror, but released st the revolution of July, I794, and n. i11 1814.

Guillofise', v. $a$. To decapitate by moans of the guillotine.

Ginn, R. [W. gwn; Ir. gunn; Scot. gyn, an ablirevia-
tion of the Fr. engin, a military engine, which word gyn became corrupted into gun.] Ao instrument consistiog of a barrel or tube, of iron or other metal, from which balls, shot, or other missiles are diseharged by the explosive force of guopowder. The largest species of guas are called cannon; the smaller species are called riftes, muskets, carbines, fowling-pieces, \&c. The nanufactare aud construction of cannon have been fully deseribed in cannon will be more especially examiged under Rifled Ordnanoe. We give a deecription of the fowling-piece, relerriug to RiyLE, for the litiost improvements in the manufatore of amalier military firearme. For sport ing purposes emooth-bored shot-gune and grooved riffes are employed. Buth are nearly always double-barrelled, and of lato years the old muzzle-loaders have been at moet entirely oupplanted by the many breect-loadiag systeme recently invented, which ensibes the eports man to reload with greatly increased rapidity and uni formity, the iatter quality beiog epecially iompurtant in riffe shootiog. Mr. Lefancheux is entitled to the credit the ingenuity of gunmakers has since devised an in mense variety of actions, and every dny eces progrese made in arreagth and wimplieity. The latest guns, how mader, leave little rocm for improvement in respect to the action. The hammers are abolished altogether, the etriker being a needle in the interior, which is driven agaiost the cap of a central-fire cartridge by a spring when the trigger is pressed; a lever on top is pustied aside by the thumb, liberating the catch which holde the barrels agsinst the false breech; the berrels then drop from the hinge, and are open lor luading. On raising the barrels, the action soape to, and hohls them fast; the dropping of the barrele causes su extractor to withiraw the smpty eartridge cnses, A kcy at the eide regulates the cocking nud shiely of Ahe Jock nud greatly differ from that of ehot-guns, Great strength and weight of barrel are necessary to resist the pres sure of the charge, withatand the wedging action of the bullet, and deaden the recoil. See The Gun and it Development, hy W. W. Greener, 1881

(Nazal.) A warrant officer, under whose immediate the ordnance and ammioition of the vesel. theory of the flight and the ecience which treate of the from canoon and smaller armos, and teeches the method of employing these weapone in the most effectual manver, for the purpose of attack and defence. The earliest treatise 00 the path described by a projectile during its fight. sceme to be one writteo by is mathematician oantileo demonstrated that a ahot fired from a pan would trace a parabolic curve in its paenaze tlironth the nir if the repists nee of the nir bad no influence, as it lins, in materially altering the form of the path it describea. It will be readily noderstood, that if the resistance of the air nad the attraction of gravitation cunld be repoved, or, io other words, if a shot could be fired in cucun, it would go on forever in a lino corresponsling to that of tho axis of the piece, produced indefiuitely, with the same ivitial velocity, or the velocity which it pos6essed when it left the cannon's mouth. But oupposing lected, and gravity alone to act on the ball it is found that the action of gravitation constantly acting on the projectile at every point of its flight, in a tine which projective at every poiat of its flight, in a line which tende to draw it ont of the straight line, which it would have described if the force of gravity did mut exint, and eventually bringe it to the ground, After descriling a parabolic curve. It was generally considered by matheunticiane, from the time of Gulileo, that the path of a prejectile was that of a parabola, nod that the reslotance of the air had but little, if any influence, in altering its form; but it was rescrved for Newton to sliow that its nace of the air and the attraction of kravitation, wae nance of the air and the attraction of kravitation, wae
that of an byperbola while pasing throngha medium that of an byperbola while paasitig throngha medium reaistance offered by the air to a projectile during le flight is proportioun to the square of the relocity of the projectile, the resistance to epherical bedies alao varying ins the square of their diameters anat the density of the medium throngh which they pass. To determine nod caleulate the time of flikht, the horizontal range, and the greatest beight to a hich a rlet will rine durlug its flight. requires a knowlelgo of trignometry, It may, however, be eaid, that the range and time of fight gun. ## GUNP

ancient and modern times, on account principally of the great diflicalty of deteriaining, by experiment, the correctoese of nay particuar as to the absolute effect of this of opiarding force (which is, in fact, the science of aeroretarding orce bodies moving in the atmosphere with great velocities; and althongh sufficient is known to great the practical ganner, still, as a ecientific question, it is one of considerable ioterest, from the fact of its eolution being so difficult, more than of its practical eomportance. Dr. Hutton, in his "Mathematical Tracts, draws the best hypothesis on the sinbect; and aperimennome of his results have been disproveory, and tested its talists who have isquired into Hotton, yet bis deductions results, siace the found correct, are by far the most trustbeing geberally found correct, are wishes thoronghly to wortay to forstigate the science of aedro-dynamice. The resistiovestugate wbich a body meets with in ite rootion through the air will first depend apon its velocity, and the form and magnitude of the sorface opposed to the Huid; secoudly, upon the density and teoncity of the flud, of conesion of its particles, and also upon the friction which wand and caused by the roughosess of the surtace or the boay, this
thirdly, npon the degre of compression to which the fluid, eupposiog it to be perfectly elastic, is eubjected, is on this dependsce buhiod the body in uotion. With is and fill the space phane moving throngh a fluid in a direction perpenflaid with which it conoes in contact a velocity equal to its own; and from this cause alone the reastance shoul be in the proportion of the velocity, but the mambin of particles struck by the moving body in a certain time beiog aleo as the velocity, it follows faid to a body causes combined, that the ress the inertia of the particles in motion, which arises from dne propertion of the square of the fluid, will be in the do moving body. Secondly, of the velocity imparted moving io a fluid must overcome the force of the a body moving io a noid musich are separated, and the
colsesion of those parts which friction, - both of which forces are totally independent of the velocity. The total resistance, therefore, from cohesion, friction, and inertia, will be partly constant anmber of particles struck and the number that are repented will be as the densitics of the media;-from Which we draw the following formnla:- - Let d represent
the density of the fluid, $v$ the velocity of the moving body, the density of the fluid, $v$ the velocity of the moving bicient
a the constant corflicient for inertia, and $b$ the corf for cohesion and friction, then ad $i^{2}+b d$ will be proporfore, are as the squares of the velocities in the same fore, are as the squares of the velocities multiplied by
fluid, and as the squares of the ver the densities in differunt fluids. Thirdly, if the boty can bo moved so rapidly that the fluid cannot instantly rush in hebind it, as ing power of the medium most be coneiderably increased; for the projectile being de prived of the preesure of the fluid on its hind par nust eupport on its fore part the whole weipaployed colnma of the fluid, over and above the force edpith it, in moving the portion of the flaid in contact with it, which force luid. Also, it must be added that the condensatiou of the air in front of the body will intluence densatiou of the air in frout of the the resistances and the velocities of an oblique eurface; and it is probable that, althongh the reaistances to a globe may, for slow motions, he nearly proportional to the equares of the velocities, they will, for great velocities, increase in a much higher ratio. The recoil of a gun must necessarily diminiah the velocity of its projectila; and tave has beeu carefully borne in mind by men who have made gunnery their eepecial etudy, as be also rememstrong and Mr. Whitworth, It must es and the greater bered, that the increased cxtent ofraoge which the firing is directed, is due to the method of rifling or grooving the iaterior of the bore of the piece, which imparts rothe interior to the missile after it has left the muzzle of the gun. The nse of elongated shot and shell also cougributes greatly to thia rcsult, as they do not present a greater amount of aurfice to he acted on by the air than spherical shot; but in consequence of their greater weight, they possess a far greater power of manntaining
Gmen'ning, $n$. The act of ebooting or huntiog with a
Gun'mison, in Ttuh Territory, a post-village of San
Gnn'uison RIver, in Colorado. This stream rises in the Rucky Mountans, and flowing N.W. unites with the Bunkara or Blue River, to form the Grand River. Gnn'ny, n. (Com.) ## GYPS

Gymnas'lleally, autv. In the manner of a gymnast. Gymnoc'andus, n. [Gr. gymnor, and kladns, a ohoot] Gymmas'ifics. A term applied to thoae exercisen of their power. Gymnatic games are of very ancient origin. They are mentioned io the secoad book of the Hiud, where playing at quoits and javelin-hurlhng are mentioted; and in the 23d book, where Achillea is represented as instituting ganpes in honor of Pistroclos, tling, quoit-throwing, \&c. Later on, games of this kiod tling, quoit-throwing. \&c. Later on, ghames of this kiod athlu, gave origin to the name athleteis, applied to these wha contended for them. Shortly hefore the time of Hippocrates, gymastics were male a part of medicine and gradualiy they were reduced ioto a complete systeta. Poblic Lnildings, called gymnusia, were erected for the purposc, and officers for their superinteudeoce wero appointed by the state. The Romans erected
gymmana on a magnificent ecale; and on account of the gymnana on a magnificent scale; and on account of the
extenvive batho which were attached to them, they extensive baths which were attached to them, they
were latterly called therma. Among the exercises practised in these gymnasia, were daucing. wrentling, bux ing, runoing, leapiog, quoit-throwing, and Lurliog. ing, rusoing, leapiog, quot throwig, had these, which formed the regular business of the gymnasium, were riding, driving, swimming, rowing, climbing ropes, swinging, mock fights of varions kinds, \&c. Various canses io later times have conuhined to canse G. to go out of uso as a part of education and a method of maintaining bealth. Mudern warfare depende so much on military ecience and a knowledge of ganoery, and oo little on phyeical strength, that
millitary $G$. has been much overlooked. $1 t$ is only eince military $G$. hss been much overlooked. It is only eince

 ©iv'roscope, $n$. (ir. garos, it circlo or rotationt sh
 time attracted attention on aceount of ita supposed capability of reudering visible the rotation of the earth on its axis. The mperatus was originally mugested by M. Foucualt, but has sibce been materially moditied. The princople on which ite actiondepends was diseov-
 Composition of Notary Mlotion; mud the oliject of the instrament is to exhimit the rabl compusitwo of rothon the same body. Thas when a huly is rotaluge whant on the sane body. Thus, when at if any force tends to make it rotate about an nxis, if any force teblets tus make it rotate about
another axis, it will mat rotate ulmat enther the old or the new axis, but abont an iutermedinte one. In ln 01 , Signor Antinori, director of the masenm at Flurence, first brought tho sulject of the apparent displacement of the platie of vibration of the pendulum hefere the Academiciane del Chachto; and on the an of Pebruary in the same year, M. Fonomilt commanicnted his discosery to the Academy of sciences at limis, and "xperimentally proved the rotation of the earth by lis ucllknown penduma experaneat nuil his $G$. In, the first either pole of the eurth wad set in oseillutum it is evi dent that a spectator carriad round by the rotation of the earth wonld so pans altermately under the two ends of the arc of the vilurating pealulom, lhat ate plane of oscillation would nuprotr to him to make a revolution from east to west io the same time an the earth revolves from west to east. If, then, the pulnlum be supursed to lee similarly suspended over the equator, it is evideat that no change in the plane of osciliation can take place. Bot if the pendulum de suepended at any intermedinte latitude, the rotation of the earth round the polar axis may be cousidereds the rem of ronthone, one and nnother round a about the latter axiecannot, however, sfict the aly eat motion of a pervdulum suspended at the equatur of that axis which is the great circle through the place of observation. The pendulum will, therefore, only be affected by a motion around the axis throogh the place, and this orotion will vary hes the sine of the latitude. The $G$,, as an instrument, is in apphication of the pria cijle in dynamics, that if a oass be set in motion freely in space, if will preserve its origioal plane of totation, unless it bo disturbed. A. Fonenat prescuted his AC count of the G. there is fised pione in his cppars, and as the fixectur is carried with causes it to appear to him as if the plape of the disc actually revolved. The experiments which can be performed with the $G$. illustrate the following principles: First, thet matter io motion, as well as matter at rest possesses inertia. Secondly, that the bower pussessed by the shots from rifled guns to resist the force of gravity, is due to the gyratory mottoa given to the ball. Thirdly, the orbital and exial ohotions are connected intimately, und mutually affect each other's speed. Fourthly, that the apparent stable equililirinm of bodied not stable, as of a spinning-top Bsletp, is due to their rotation

Among other worke from his pev, are thuse entitled The Uprising of o Great Nation, and America in the 1-rescnce of Europe (1861-2), both Gas-wells. (Geol.) Withín late yeare, phenomens io the slupe of natural gaseons ex adations bave beca discovered in several of the Northero States of the Udion, particularly at Fredonia, in N. Y. (which town has loog been lighted with this natural gas), at Erie, Penoa., and at places in Ohio and Michigao. At Painesville, Ohio, the sinkiog of gas-wells, after the maniser of the Penusylvania oil-wells. Was successfully accomplished in the year 1871. Two gas-wells were first bered, in ooe ficient quantity to rum the ellage, gas was found in eufft . below the surface of the earth. Winle at to foet lower, the gas became still more aliundant at 200 feel after being bored to a depth of $600 \mathrm{ft}_{\mathrm{t}, \text {, yields a sufficient }}$ volume of gas to light up a lerge city - gas, too, of great purity, and used not only for illuminating, but also for beating purposes. When employed for the latter, the manacr of its use is as follows: An imitation of logs mate of terra-cotta is connected with the gas, Which, when lighted, presents sll the appearance of cajital fire of hirning wood. By turning a smant hascet near the liearth, the blaze is nade to merease or dimin-
ish at will. Its igaition leaves no sout or smoke, and house-lires can be as readily lighted by ite means a are employed fur the duily consmmption or the gns atitution for coal and wood las beep found to malie it a very ecodomical kiod of fucl, and also a highly convenient und inanageable one. The well just referred to, when bored to the depth of 700 ft , was found to contain so powerfol a volume of gas that the water in the bore was flung back with euch force ns to mearly threaten with demolition the roof of the works above At Conneant, some 60 miles to the west of Painesville. a Papr Company have hored a bew gas-well, the hame of which ascerds above the mouth to a height of oearly 20 reet. Wells mear creveland have bcen found to yield mentical in its bitmmous coal, has become employed io illuminating tie linters of the portland purtor lirhthouse on Lake Erie. At Erie, peone scveral wells have been dored with excellent reaults, the gas supply being apparently linitlea, nod turned to vise for manufactoring purposes. The water-works of the ciry have two large engines at work pumping up water; which engives are impelled by steam generated by the flow of gis from a well sunk in the worke, and the flate of which issue from a snccession of small pipes condected with the gas-well.

while they more generally do well when isolated in cold hooses. But the generiblluth of the first entemeat tive vioes, which for a while were goiversal favorites on account of their productiveness, vigor, sad other excellent qualities, have of late years sadiy deteriorated. Among snch the Cutawba was for a long time the prpular grape: fut its cultivation is aow eatirely abandoned is nany parts of the Blississippi ralley; and evea at Hammoodsport and other parts of New rork, and
Nanroo, 1 lifoois, where it is still largely cultivited, Nonvoo, 1 llioois, where it is still largely caltivuted, I the decline. This deterioration-this failure-has been the dechine. attrything definite nod ascertaioable to kecp it within anything definite nadive ascertan of our minds is sure to have foll scope, and, graspiag at every shadow of probahility, leaves ao possable theory unscarched. As in al such cases, also, the miad gets lost io, and is satisfied to vacuely rest with, the theory least provable; and to some occult and mysterious change of chmate we are at hast satisfied to attribute the change, though, if the meteorological records were carefuly exammed, the condition of our climate during the past half ceutury condition of our climate during the past hal century: origin should be less hardy in this country thee our native varieties, - that, as in the case of the Sputish chestant, the English gooscherry, etc., etc., there is sonething io our climate which precludes their flour ishing as well bere as there, 1 wond by bo neans dony that such is the case, for it is this very comparative tenderness which predispusis them the more to the destructive agent of which I am ahout to speak Yet when we consider that in some parts of Europe, where the viue fourishes, hat we possuss a preat vari cold are as great as here, that wo bosserisg ond other modes of protection in wioter, we may, where neces modes of protectios in wioter, we may, where neces
sary, connterict the rigor of the latter, it would appear sary, counteriat we certainly have attributed too mnel to cli matic influence; and surb a view is btreogthened by the fact that our oative varieties, if fres from the insect which fornis the suljeet of this article, nstually do well when cultivated in Europe, and lurther that the Vitis rinifera is not a native of Enrope, but of western Asia. The above reflections are of a genenal character, but apply more particularly to the great State of Missonri, which is admitted to be, io manly parts, eminently sdapted, hoth ony of the reasons wliy the European vines do well io Californa, outside of and beyoud the more fayorsble clime in that purtion of the contigent is, po doubt, becanse the iusect which here effects them, like many other species common on this side of the Rocky 3lonutaine, has not yet crossed to the other side. If such is the case, our California neigh bors should take warning from Enrope, and guard, if possible, arainst an invaston. The antonacemeut that I have at last ascertained one of the principal canses If not the sole canse. of this decline, and that, knowne the canse, we may in a measure obviste it, will doubreven pooh-pooh the idea, and deem it impossible that ven pove so loug remained in ignorance of so importhey have so that a somb-hunter, should discover it at last. Let the facts speak. This destructive agent is none other than the little insect we are now treating of. There can he no longer any shadow of doubt that the Europeau and the American insects are idenficalds of France, aud bronght with me, from that country, both wiuged male aud female specimens, preserved in acetic acid. 1 find that the insect has exactly the same halnts here as there, aud that winged speciarecon fectly with those bruught over with me. In the different forms the insects assame, in their work, and in all other minutia, the two agree. - Why 1 consider the Galt-louse and the Root-louse itentical. First, wherever this insect has been noticed in England, looth the gallinhahiting and root-inhabting types have been fonod. In France, the galls occur abundantly ou such of our American varietics as ara subject to them here; while a few have occasionally beeu found on their own varieties. Secondly, I have buccesstully transferred the leaf-lice on to the ronts, while 3 . Signoret has succeeded in obtainiog leat-gralls from lice hatched on the
roots. Thirdly, the winged form obtained by Dr roots. Thirdly, the winged form obtained hy br Shimer from the galls in this country agrecs in
its characters with those from the roots. Fonrtbly, the nodositics on the roots are, as already stated, perfectly nodositics on the roots are, as to the galla on the lease, and differ only in just snch a manner as one would expect from the difiereuce in the plant tissues - a view greatly strengthoned by the fuct, that when the gall-lice are forced, hy their exceasive aumbers, more vearly to thuse on the roots than to the galls These facta sufficiently attest the ideatity of the two types, and we have here azother case of an insect pos
gessiog two distinct habits. It is also like many others of ita family. pulymorpinic, i.e., it exists in different of its fanily. polymorphic, i. e., it exists in differeat foung batched from the eggs on the roots are abso galls; and the gravid apterous female differs in oo re spect wharever from the mother tall-louse. There is
how wer a different ege-depositing form, which, as it moults, becomes tubercied, and more elongated or pear shaped. Sume of these tukercled individuals remain
withont wings, while others seem to be deatined from the first to acquire wings. The young, after attacling themaselves, become in a measure btationary, thad re-
miad one very much of young bark-lice. The time hairmiad one very much of young bark-lice. The dian and like seta, which in their fmetious and elasticty are analogens to onr tonge, Acome foosened from thy more feshy sostr its phaco gencrally hangs by them. Three of the therenis of this tuppue are sutticiently conspicuons, but there should be from nmalogy, foor. The females on the reots seem to be less prolitic than those its the galls, and their eches, if anything, are rather larger. These eggs are always of a bright $y$ chow color, aul, on the dark root, are detected with the naked eye as readily as the
lice, which become darker or of a dull onange ns they lice, which become darker or of a dull onamge ns they
grow older. The insect is fouod on the rowts in all grow older. The insect is fouod on the rotd in all
stages during the summer mooths. In the winter it is stages during the summer mooths. In the winter it is
feund dormant, principally in the larva state, and ne found dormant, principally in the larva state, and nen egps are to be sect. Wing, the activity of these young recominences, and in a short time afterwarils egys ure deposited again. At this serson the punctures of their little leaks produce very decided swellings and no excess of moisture at the wonbided parts. The winged forms are by no meanh nncommon, and commence to issne from the eround perluaps as early as Jnty. When 1 last examined the roots before my departore, or ahont the midille of May, no pupee were found; lnt winged insects were obtained as carly ns July in Fraoce, and after my return I had un difficulty in ohtataing all I wished, eqpecially duriog the latter part of Soptember. The puphe are easily recngnizable with a good lens, by the ditto the pad-like wing-sheaths at the sides of the bady, and the
Rexes may even be distinguished at this stage by the sexes may even be distingnished ar these greater constricion of the bedy wer abdopien bein larger. Before giving forth the winged iosect, these
pnper become quite restless and active, and io a state of nature they po douht issue from the gronad. The wioged

Fig. 47, - paylloxera fastatrix.
Dorsal and ventral view of the winge feruate, considerably magn
ficd (the natural size belug thowa by tbe nir-linee ac the side)
female (Fig. 4i) seems to he much more common than the male, and is distingnished by her more lengthened abdomen - the wings, when closed, extending not much more than its length beyond the tip, while in the mate
they extend more nearly three times its length. The dnsky theracic band is not so distioct, and the abdomen is more produced at the apex in the male; aud there is also a slight difference in the vebation of the wings of
the two sexes, which venation is lest seen in the freah the two sexes, which venation is best seen in the frem specimeus. as it becomes in a meanure two or three
drying. in the alulomen of the female two large egks are plaisly visible, espuccally after veiog soaked in acetic acid. The two-jointed tassus or foot is also plainly visuble in such specimens, and 1 have
fouad the joint movable, while M. V. Sugnoret, of Puris has obtained the skin of the tibia or shank with the hasal joint of the tarsus baosing to it. Prof. Westwood slso refers to a short basal tareal joint io the gall inseet which he described. These facts, trivial as they may appear, are very important is a scientific view, as they forever settle the differences that hate existed is to the proper systematic position which susceptituty of Diflerent hines to the sttucks of the Louse. I have carerolly examined a great many different kinds of vines within a circnit of 30 m . of St. Lonis, as well as in Cole, Jufferson, and Boone countics, the susceptibility of the different varieties to this disease. Irape-growers of the conntry, aud have had an opportunity of studying the genus by the excellent herpartum of Dr. Engtuann. It is gratifyiog to know, therefore, that the position given to buch cultivated varieties as ohtain in this herbarino, agreps with that given to them by leading grape-growers- the siews of
the botanist sud the practicsl man coinciding. The proper classification of onr differeot varjeties isof more importance in this counection thas wonld at first ap-
pear. Suace the publication of some of the facts set
forth In thia article, a few enterprising French grape growers, in the dintricts desolnted by the louse, huve
conceived the idea of moporting from this country nuch conceived the idea of mporting from this country such
varietios as arn most "acmit toon the attacka of the Phylhaxer, and M. Le Franc, the Minibler of Agrit ul thro, has likewane expreseed lis iotention of so doing Alremly at bumber of vatieties, and expecially the llartford Prolitic, Clmen and Martha, liave ber shippod to \$1. Ite received his education at the college of his oative city, the ky arsitssia of Carlsruhe he Carmed an intimate frieailship with Agassiz, A. Brawn, furmed Schmper; and in this inspiring coapany began the study of plyakcal scieace. He studied theology for four years at Neufchatel and Berlin, but has own natural tasters and the suciety of Humboldt, Carl Ritter, and Steffeus led him to devato himself to physical science In 1835 be was graluuted Ph. D. at Berlin Vniversity, his thesis being tedicated by permissios to IIumbold and Kitter. He then proceeded to Paris, where hespent five years io tenchagraod stany, making scientic tours
duriug the summers in France, Belgium, Holland, and

Calt, Joan, a Scottish novelist, d. at Irvine, 1779. His most esteemed works comprise the Ayrshite L cgotecs Lavric Todd (1830), and a Life ef Lord Byron. D. 1839. Gambetta. Lfon, (gim-bit'toh.) a Fresch stat esman, B at Cahors, of a fienouse ancestry, Oct. 30, 18;8. He became a member of the Parie bar io 1859 , and scee ac quired fame as a forensic orator, beiog mucb employed in political canses louth in the capital and the provinces, while he grew into great popularity among certain classes of the Parisians oo acconnt of his radical and extreme Republican opiaions. In March, 1869 , on the occasion of the goveromeat prosecution of the jourbal "Emancipation" at Tonlouse, G. received quite ao oraheld in the same year, he, as a representative of the held in the same year, he, as a representative of the arrecoacilabencies of both Paris and Marseilles, aod elected to take his seat for the latter. In J:in., 18io, he distinguished himself by violently attacking the Ollivier guished himself by rioleutly attacking ame onistry, declaring that the day would come when the majority of the people wonld, without appeading to force, succeed in establishiag a republic. On the fall of the empire ad the coasequent formation of the government of the National Defence in Sept., 18\%0, he Was nomioated Minister of the Interiur. and soon showed that he pussessed admiaistrative abilities of high order. Wheb a serious misuoderstaading thok place betweea the Delegato contemplated election of deputies, $G$. was selected by contemplated electioa of deputies, $G$. was selected his conleagues to proceed the position of affairs in the capital. Accordiagly he the position of affairs in the capital. Accordingly mand-Barbes," accompaaied by a secretary and an aëroaant, passed safely over the Prussian lines, aod reached Ronen ia the eveuing. Proceediag withunt delay to Tonrs, he there assumed the direction of affairs, sod for sonse months was virtual dictator of all those proviaces of France which were free from the Qerman invaders. Lle urgel the people to continued resistance, raised the Ariny of the Loire, and after the eoforced re moval of the Delegate Government to Bordeaux, he resistance veren to absolute exhaustion. It is scarcely necessary to aid, that his dream of ridding the French soil of the German husts was nut realized, and that his volututeer srmies were completely crusbed by the well tranned forces of the egemy. On the 6th Feb., 1871 ,
MM. Aragu, Garuier Pagés, adad Eugeve Pelletas, mem-

Galvanom'eier, $n$. In overland liaes, the electric current traverses the wire suddenly, like a bullet, und at its full strength, so that if the current be suflicieutly 6trong the instrumeats will be worked at once aud no cables we lost. But itron is slow and varying. It travels along the wire in the foror of a wave or undula tion, and is received feebly at first, then gradaally rises to its maximnm of strength, and finally dies away again as slowly as it rose. In the french Athatic cable as scupe at America for the first tenth of a secoad after it cope but on lirest; and it takes about half a second for the reccived current to reach its maximum value. This is owing to the phenomenoa of induction, very importazt in submarine cables, but almost eotirely absent in land lines. In submarige cables, the wire which contams the currest is iosulated from the sea water by an envelope, usually of gutta-percha. Now the electricity sent into this wire itaduces electricity of an opposite kind to itself in the sea water ontside, and the attraction set up between these twe kiods "holds back" the curreat in the wire, und retards its passage
to the receivinu station. It follows, that with a receivto the recerving station. indicate a particular streagth of current, the rate of sigualling would be very slow on long cables compared to land lines, and that a different form of iastrumest is required for cable work. This stood greatly in the way of carly cable enterprise. Sir Williain Thomson first solved the difficnity by his invention of the "mirror $G$."" and rendered at the same time the first Atlantic Cable Co, a combercial success-
The merit of this receiviog instrument is, that it indiThe merit of this receiviog instmment is, that it indi-

## HAAR

H
The eighth letter in the English lengunge, le an/ IMaar'lem, (Lake of.) Ses page 1273. aspirate belonging to the order of gutturals in auation of the sound expressed ly the Greek $\chi$ pod atteniation of the sound expressed lyy the Greek $\chi$ and
the German and Scottich ch. The claime of $h$ to be regarded as a letter have been denied by many grammarisus: and certainly, when it is remembered that the sound of this letter is produced by a mere emission of the breath, without any conformation of the organs of
speech, this opinion would seem well founded. The form of the character corresponds to the Phoenicinn or Hebrew cheth $(\boldsymbol{\sigma})$ and the Greek ota (H. probably at nne time pronounced hirta), which denoted originally the syllable che. The figure II was used hy the Greeks to
signify the aspirate, until about the 5th century before gignify the aspirate, until about the 5 th century before
Clarist. After that time it was gradually abandoned in Christ. After that time it was gradually abandoned in
Greek writing, while ite nes was still preserved by the Latins. In the former language it was superseded by the small mark culled the spiritus asper ( $\%$, which was placed above the letter to which the aspirated sound have been faint, is sufficiently attested by the fact that many words were written indifferently with or without an $h$; as honestus or onstus. In mady Latin words the letter $s$ represents the Greek aspirate, as sub for $i=6$, sal
 In the languages derived from the Latitu, the force of $h$ a character, but is rarely heard in pronunciation. In a character, Iot is rarely heard in pronunciation. In has become substituted in many cases for the Latin $f$, as hijo = Lat. fliuss, a bon: humnoso ffumosus, Emoky. In
the languages of the Gothic atick, $h$ sometimes, repre ente the Latin $e$ and the Greek $\kappa$; as, in horn, Gothic halirn, Lat. cornu, Gr. népas. This substitution, and the subsequent absence of $h$, particularly before $r$ and $l$,
have completely obscured the kiodied character of many words which derive from the same root ; as, for instance, Eog. raw, A.S. hreaw, Lat. cru-or, blood, cru-
dua, bloody, raw. In English, tho letter $h$ may be condus, bloody, raw. In English, tho letter $h$ may be considered as peculiarly indefinable with regard to its or-
thoepical position. The natural tendency in this lunthoepical position. The natural tendency in this lunguage (as in those derived fron the Latin) is to altogether
eliminate the $h$; and this practice prevails, nccoruingly, climinate the $h$; and this practice prevais, nccoranglo
among the lower orders of English people to on almost ineradicable extent,-a fanlt which the English-speaking diatectical provineialisms) are notably exempt from. In many districts of Englnnd, (and especially among illiterate Londoners,) the practice of subverting the proper use of $h$, or, in othar wordb, omitting it whare needed and appirating it where it ought not to bo, may be exemplited, as in ome for hone, hegg for eyg, \&c. Agan, another difficuity is found in correctiy locatiug tise prowhich it io the first letter it ought to be aspirated. The rulo governing this use of the letter is but vague: in heir, honor, hour, herb, with their derivatives, $h$ is silent. It is generally defined to hear a mute signification in humble, hospital, humor, \&eci tut the rule is not absolute in thesa instances, maoy good speakers recognizing the sound of the $h$. $H$ is bilent after $g$ initial, as in $g$ host, ghoul, ghartly, gherkin; after 7 , as in catarrh, myrrh, Thomi, rkyme; and also when following a nono in the ployed in conjunction with certain consonants to form pligraphe expressing sounds which are not represented in the alphabet, as sh, $h$, th, as in should, think, thus; also, to qualify the sonnds of some other letters, as when following $c$ and $p ;$ with tha former producing a compound sund like that of thh, as in change, chapet, with the latter of f, us in phosphorus, phantam, Phithedephia. Again, $h$ coming atior $c$ and $y$, has tha hard intunation befuro e, i, and $g$, as is clironology, chemistry, Ghetto,

## Maba'ma.

Hab'eas Cor'pris. [Lat., yon may have the boay] (Law.) It is oue of the first oljects of all civil institutions to secure to every member the rights of personal liberty, or, in otber words, the control and disposition of his own person, at his own will and pleasure, in sach
mavoner, however, as nut to violate the laws or infringe manner, however, as nut to violate the laws or infringe
upon the rights of others. It may ecem, upon the first upon the rights of others. It may ecem, upon the first consideration of the subject, that this is nut an object since the surereign, and those representing hime in an executive or military capacity, waty seize end imprisoo any one, with or without cause, or wpon stounds more or less important and excusable, according as the government is, in its principles and in its administration, more or tess arbitrary. But a slight reflection will show that, even in the most arbitrary governments, the first olject is to secure one subject from the seizure of his person or the violation of his rights, whether of person or property, by another; for in a community of men, Where every mernber shomid be lert at liberty to seize pown and imprison any other, if he had the physical practical purposes, no government at all. There might be an association of men actiug under the orders of the prince, and in concert with each other, who should have moro power than any other association in the community, and who might, accordiagly, by the right of the strongest, seize porsons and property at their own will and pleasure ; but such en association would hardly deserve the name of civil polaty or government, which signifies not merely physical power and superiority of force, which exists among brutes as well as men, but a bod rights of ther ally fection in the constitution and lawa of the etate. In every government, therefore, whether arbitrary or frae, or occupying any ons of the various degrees in the scale of freedom, one of tha first and must important oljects is the security of the person from violence or detention not authorized by law. There ie, then, this essential difference, in this respect, between different govern-ments;-in thosa which are arbitrary, the present will of the sovereign, and, accordingly, of those representing him in civil and military capacities, is the law; whereas, in others, the law is a fixed rule, whichevery citizen or sovereign and the magistratea being bound by this law no less than the other members of the suciety. This fixed law enttles beforehand all the casee in which any person may ba detained or iuprigoned; ond the term imprisonment, in this application, does not siguify merely shuttiog up in a gaol, binco the voluntary detention of a person in a privnte house or in tha streets, saye sir Willians Blackstone, is an imprisonnient. The eases in which imprisonment is lawful being thus ascertained by the law, the great provision of Magna Churta (q. v.) Intervenes, namely, "That no freeman sholl be seizad law of the land." The term equuls or pers liers hue reference to an indictment or trisl by jury here, has body, of which the offica and functions are equivalent to those of jurors, as is tho case in rogard to the House of Lords, in respect to certain parties and offences. This particular mode of necusation or trial aight us well be omitted, and the rule would then stand, that no man should be imprisoned but by the law of the land. It ia tha law alone that can imprison, and not tho soveraiga, or any representative of the suvereign, whether the sovereiguty resides is one individual, or a body, or more than one boly of men. This principle constitutes the cading festuro of Mayna Churcu, and hes of the fonnda-解 ment, which requires, in the cues of crimes und some others, the restraint of the porson, it is ubolutely essential that the law should not only specify explicitly the ases in which the eitizen may be mizul or imprisuned but also provide that ho shall not be arrested, or rostrained of his liberty, in any other caso whutever; and such is the law in the U. Statey and in Eughnne. Nor is this principle conflined to the pernon, it being no less
tho law that a man's goods, setting isside his persin, shall not he neized and dutained, otherwise than by order of the of such loing tho ruke diat ho al tho founda tion of civil suciety, tho very impurtant queatioun occur: how thene rules are to be entorced; how in tho law the involabitity of hin pwrom and property? The firnt and mont obvious encurity is that dorived directly from the low of muture, and nut surrendered among theother sacrifices mutu by the members of a community to oach other, an a condition procedent th the furming of civi society. The law permite every minn to defund bis person and property, aul to repel by firre, any unlawful
Invenon of ether. 16 will nut juelify him in uilop ex Invanion of etther. It will not Justify him In uniag ex trema force, ant commititigg any outrazeous, diaprojor

 of bature aflords but a fecther protection, and men unite

In commanities for the purpose of obtaining moro effectual defences aganst wrong, and reparations for of the law is to inflict punisbment for any wrongs and riolence whereby the publuc is disturleel, and also to make reparation to a party injured. If one man unlawfully seizes the property, or imprisons the person of an other, he is, by the laws of every community, liahle to make amends in damages. As far, therefore, as an injury is such that it can be repaired ly a pecuniary compensation, and as far as the trespasser is able to make such reparation, the remedy is completc. But for injuries, and some injuries are such that pecuniury damages are not on adequate repuration, and pecuniury cause the law intends to prevent wruugs, as well as to povide for puniblerents and compensations where they have been committed, it provides certain processes fur immediate prevention, in case of a viulent and pnat thorized invasion of property or person. Of this characer are the processes on complaint for forciluse entry on real estate, the action of replevin in respect lo goods and ehattels, and the writ de homine replegiando, or writ of $H$. C., in respect to the person. The writ de in fact, as its name simports the replecying of a ma ie, When a country, so that he cannot be found, then a process take place somewhat similar to that sdupted when goods are carried off, so as nut to be repleviable. In the case of the goods, a process in coithernain isales, by which other goods are taken. So in the case of the man; the person who thus conveged him away io himbelf taken io a pro cess in withernam, as a pledge for the restoration of the person sought to be replevid. This prucess of replevy Ing a man it very anciedt in the Englimh law; forme of the writ beang kiven hy Fitzherbert, and also found in 400 yurs ulter the date of Nagna Churta that an aie quate remedy was adopted, whereby the great privilege provided for in that charter, was effectually sucured This passed in tha 31st year of Clarles II. c. 2, which has been adopted, in sulistance, in all the $\dot{U}$. States; and many of the State constitutions expressly gunrabtecto the citizene the right to this writ, as one of the fundamental priuciples of the governanent; and by the Con atitution of the U. States, the privilege of this writ is eccured, at ell times, except in cases of rebellion or it vasion, whea the pubnic barety may require its aunjen the same chos it ling lo be suepended in Eliglomd the executive with ang extroorlinary puwer iss the ki mans were in the habit of chousing in dictator in emer gencies, when the pnblite was in danger. This, as Sir Willian Blackstone says, is the swrifice of the security of personal liberty for a time, the more effectually to secure it in future. At all times, when the privilege is aot suspended by law, cvery citizeu has a right to this writ. It is, however, to 10 purposo that the party should ba brought beforo a jutge, on habras corpus, to be immediatoty remanded to prison. The laws, accord ingly, except certain cusse; thus the laws of New link provide, thatir a jorsoa is but an convict,or in execution plainly expressed in tho wurrant, and has not ueglected to apply to bo released for two whule ferms, he is entio tled to this writ. An application nay be made to a judge, either in court or out of court, for thim writ ; and If it dues not appear that the personn is imprisoned uuder some of the ctrcunstancen ulove named, or if it le in eome other Stata that New York, if it does not appera to the judge that his chase comee under some of the vxceptions provided by the haw of the State (and the laws except only the plawnst cases), then it is the alusplute duty of the jor gaver, officer or persan who detuins the complainnut,
ordering lim to bring the prisoner beforo him. The lnww of Eiagland provide thatt, is the Chancellor or any of the I2 judgiss relused the writ when the purty is ontitled to it, he incurs a very beary forfuiture tu the complainatit It is universally, in the U. states, the iaperative dity of the juign to ordur the complainant to be inamediately trought before hum, unless his case plainly comen with in une of the exceptions pointed out by the law. The party belng shus brought up, tho jidge determine whether ho is entitled to lo dischurgied, absolutely, or to to dlacharges on goving a cortant bail, or must he remanded to prisun. If the imprinotiment is wholly
unauthorised, the compalasnt te dimelariced; if tithe unauthorised, the complalnant is dincharged; if it he not unauthorized, but in yet for a enume in which the
party iu entitled to lie diacharged on kivink lonit, the judge orders accordingly. This is the writ whirh is jueliy denuminutet thr great buluark nut vecoud Mygna
Charta of Jritinh literty. And it in no lens the bulwark of Anerican than of Iritiah Hiberty; for it nut only protects tho clifen frum unlawful imprisomanent, at the
